

Important Information

Thank you for choosing Freenove products!

Getting Started

First, please read the **Read Me First.pdf** document in the unzipped folder you created.

If you have not yet downloaded the zip file, associated with this kit, please do so now and unzip it.

Get Support and Offer Input

Freenove provides free and responsive product and technical support, including but not limited to:

- Product quality issues
- Product use and build issues
- Questions regarding the technology employed in our products for learning and education
- Your input and opinions are always welcome
- We also encourage your ideas and suggestions for new products and product improvements

For any of the above, you may send us an email to:

support@freenove.com

Safety and Precautions

Please follow the following safety precautions when using or storing this product:

- Keep this product out of the reach of children under 6 years old.
- This product should be **used only when there is adult supervision present** as young children lack necessary judgment regarding safety and the consequences of product misuse.
- This product contains small parts and parts, which are sharp. This product contains electrically conductive parts. **Use caution with electrically conductive parts near or around power supplies, batteries and powered (live) circuits.**
- When the product is turned ON, activated or tested, some parts will move or rotate. **To avoid injuries to hands and fingers keep them away from any moving parts!**
- It is possible that an improperly connected or shorted circuit may cause overheating. **Should this happen, immediately disconnect the power supply or remove the batteries and do not touch anything until it cools down!** When everything is safe and cool, review the product tutorial to identify the cause.
- Only operate the product in accordance with the instructions and guidelines of this tutorial, otherwise parts may be damaged or you could be injured.
- Store the product in a cool dry place and avoid exposing the product to direct sunlight.
- After use, always turn the power OFF and remove or unplug the batteries before storing.

Any concerns?  support@freenove.com

About Freenove

Freenove provides open source electronic products and services worldwide.

Freenove is committed to assist customers in their education of robotics, programming and electronic circuits so that they may transform their creative ideas into prototypes and new and innovative products. To this end, our services include but are not limited to:

- Educational and Entertaining Project Kits for Robots, Smart Cars and Drones
- Educational Kits to Learn Robotic Software Systems for Arduino, Raspberry Pi and micro:bit
- Electronic Component Assortments, Electronic Modules and Specialized Tools
- **Product Development and Customization Services**

You can find more about Freenove and get our latest news and updates through our website:

<http://www.freenove.com>

Preface

ESP32 is a micro control unit with integrated Wi-Fi launched by Espressif, which features strong properties and integrates rich peripherals. It can be designed and studied as an ordinary Single Chip Microcontroller(SCM) chip, or connected to the Internet and used as an Internet of Things device.

ESP32 can be developed using the Arduino platform, which will definitely make it easier for people who have learned Arduino to master. Moreover, the code of ESP32 is completely open-source, so beginners can quickly learn how to develop and design IOT smart household products including smart curtains, fans, lamps and clocks.

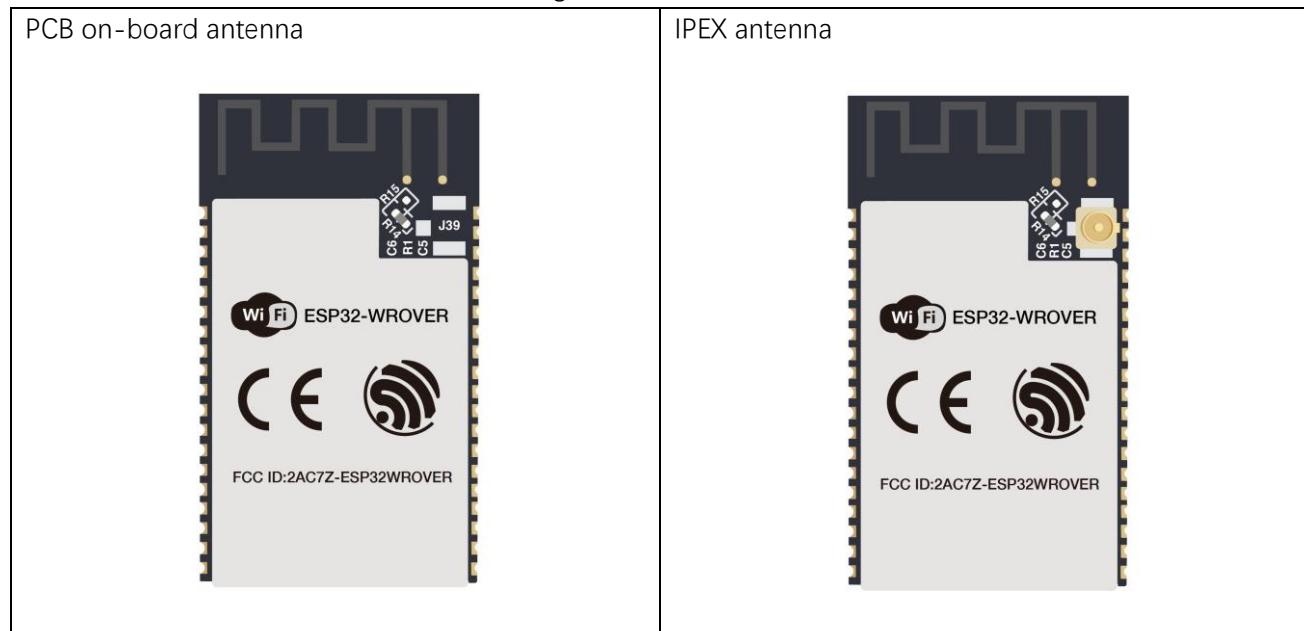

Generally, ESP32 projects consist of code and circuits. Don't worry even if you've never learned code and circuits, because we will gradually introduce the basic knowledge of C programming language and electronic circuits, from easy to difficult. Our products contain all the electronic components and modules needed to complete these projects. It's especially suitable for beginners.

We divide each project into four parts, namely Component List, Component Knowledge, Circuit and Code. Component List helps you to prepare material for the experiment more quickly. Component Knowledge allows you to quickly understand new electronic modules or components, while Circuit helps you understand the operating principle of the circuit. And Code allows you to easily master the use of SEP32 and accessory kit. After finishing all the projects in this tutorial, you can also use these components and modules to make products such as smart household, smart cars and robots to transform your creative ideas into prototypes and new and innovative products.

In addition, if you have any difficulties or questions with this tutorial or toolkit, feel free to ask for our quick and free technical support through support@freenove.com

ESP32-WROVER

ESP32-WROVER has launched a total of two antenna packages, PCB on-board antenna and IPEX antenna respectively. The PCB on-board antenna is an integrated antenna in the chip module itself, so it is convenient to carry and design. The IPEX antenna is a metal antenna derived from the integrated antenna of the chip module itself, which is used to enhance the signal of the module.

In this tutorial, the ESP32-WROVER is designed based on the PCB on-board antenna-packaged ESP32-WROVER module.

ESP32-WROVER

The hardware interfaces of ESP32-WROVER are distributed as follows:

Compare the left and right images. We've boxed off the resources on the ESP32-WROVER in different colors to facilitate your understanding of the ESP32-WROVER.

Box color	Corresponding resources introduction
	GPIO pin
	LED indicator
	Camera interface
	Reset button, Boot mode selection button
	USB port

Name	No.	Type	Function
GND	1	P	Ground
3V3	2	P	Power supply
EN	3	I	Module-enable signal. Active high.
SENSOR_VP	4	I	GPIO36, ADC1_CH0, RTC_GPIO0
SENSOR_VN	5	I	GPIO39, ADC1_CH3, RTC_GPIO3

SHD/SD2 ²	17	I/O	GPIO9, SD_DATA2, SPIHD, HS1_DATA2, U1RXD
SWP/SD3 ²	18	I/O	GPIO10, SD_DATA3, SPIWP, HS1_DATA3, U1TXD
SCS/CMD ²	19	I/O	GPIO11, SD_CMD, SPICS0, HS1_CMD, U1RTS
SCK/CLK ²	20	I/O	GPIO6, SD_CLK, SPICLK, HS1_CLK, U1CTS
SDO/SD0 ²	21	I/O	GPIO7, SD_DATA0, SPIQ, HS1_DATA0, U2RTS
SDI/SD1 ²	22	I/O	GPIO8, SD_DATA1, SPID, HS1_DATA1, U2CTS
IO15	23	I/O	GPIO15, ADC2_CH3, TOUCH3, MTDO, HSPICS0, RTC_GPIO13, HS2_CMD, SD_CMD, EMAC_RXD3
IO2	24	I/O	GPIO2, ADC2_CH2, TOUCH2, RTC_GPIO12, HSPIWP, HS2_DATA0, SD_DATA0
IO0	25	I/O	GPIO0, ADC2_CH1, TOUCH1, RTC_GPIO11, CLK_OUT1, EMAC_TX_CLK
IO4	26	I/O	GPIO4, ADC2_CH0, TOUCH0, RTC_GPIO10, HSPIHD, HS2_DATA1, SD_DATA1, EMAC_TX_ER
NC1	27	-	-
NC2	28	-	-
IO5	29	I/O	GPIO5, VSPICS0, HS1_DATA6, EMAC_RX_CLK
IO18	30	I/O	GPIO18, VSPICLK, HS1_DATA7
IO19	31	I/O	GPIO19, VSPIQ, U0CTS, EMAC_TXD0
NC	32	-	-
IO21	33	I/O	GPIO21, VSPIHD, EMAC_TX_EN
RXD0	34	I/O	GPIO3, U0RXD, CLK_OUT2
TXD0	35	I/O	GPIO1, U0TXD, CLK_OUT3, EMAC_RXD2
IO22	36	I/O	GPIO22, VSPIWP, U0RTS, EMAC_TXD1
IO23	37	I/O	GPIO23, VSPID, HS1_STROBE
GND	38	P	Ground

Notice:

1. GPIO12 is internally pulled high in the module and is not recommended for use as a touch pin.
2. Pins SCK/CLK, SDO/SD0, SDI/SD1, SHD/SD2, SWP/SD3 and SCS/CMD, namely, GPIO6 to GPIO11 are connected to the SPI flash integrated on the module and are not recommended for other uses.

For more information, please visit: https://www.espressif.com/sites/default/files/documentation/esp32-wrover_datasheet_en.pdf

Any concerns? ✉ support@freenove.com

Extension board of the ESP32-WROVER

And we also design an extension board, so that you can use the ESP32 more easily in accordance with the circuit diagram provided. The followings are their photos.

The hardware interfaces of ESP32-WROVER are distributed as follows:

We've boxed off the resources on the ESP32-WROVER in different colors to facilitate your understanding of the ESP32-WROVER.

Box color	Corresponding resources introduction
Red	GPIO pin
Blue	LED indicator
Cyan	GPIO interface of development board
Green	power supplied by the extension board
Magenta	External power supply

In ESP32, GPIO is an interface to control peripheral circuit. For beginners, it is necessary to learn the functions of each GPIO. The following is an introduction to the GPIO resources of the ESP32-WROVER development board.

In the following projects, we only use USB cable to power ESP32-WROVER by default.

In the whole tutorial, we don't use T extension to power ESP32-WROVER. So 5V and 3.3V (including EXT 3.3V) on the extension board are provided by ESP32-WROVER.

We can also use DC jack of extension board to power ESP32-WROVER. In this way, 5v and EXT 3.3v on extension board are provided by external power resource.

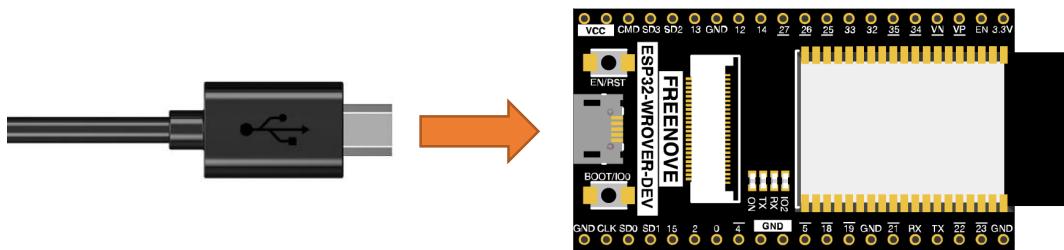

CH340 (Importance)

ESP32 uses CH340 to download codes. So before using it, we need to install CH340 driver in our computers.

Windows

Check whether CH340 has been installed

1. Connect your computer and ESP32 with a USB cable.

2. Turn to the main interface of your computer, select “This PC” and right-click to select “Manage”.

3. Click “Device Manager”. If your computer has installed CH340, you can see “USB-SERIAL CH340 (COMx)”. And you can click [here](#) to move to the next step.

Installing CH340

1. First, download CH340 driver, click <http://www.wch-ic.com/search?q=CH340&t=downloads> to download the appropriate one based on your operating system.

index / search / search CH340

If you would not like to download the installation package, you can open “[Freenove_Super_Starter_Kit_for_ESP32/CH340](#)”, we have prepared the installation package.

Name	Date modified	Type	Size
Linux	8/14/2020 5:24 PM	File folder	
MAC	8/14/2020 5:23 PM	File folder	
Windows	8/14/2020 5:23 PM	File folder	

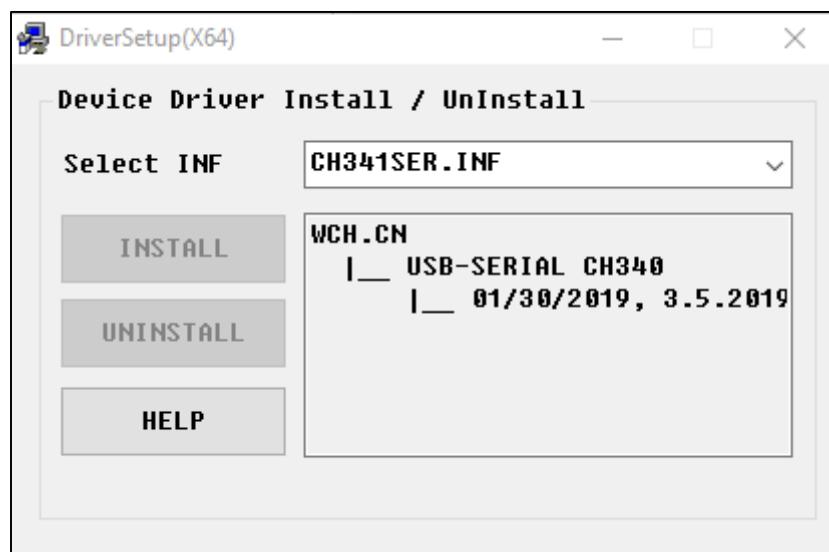

2. Open the folder “Freenove_Super_Starter_Kit_for_ESP32/CH340/Windows/”

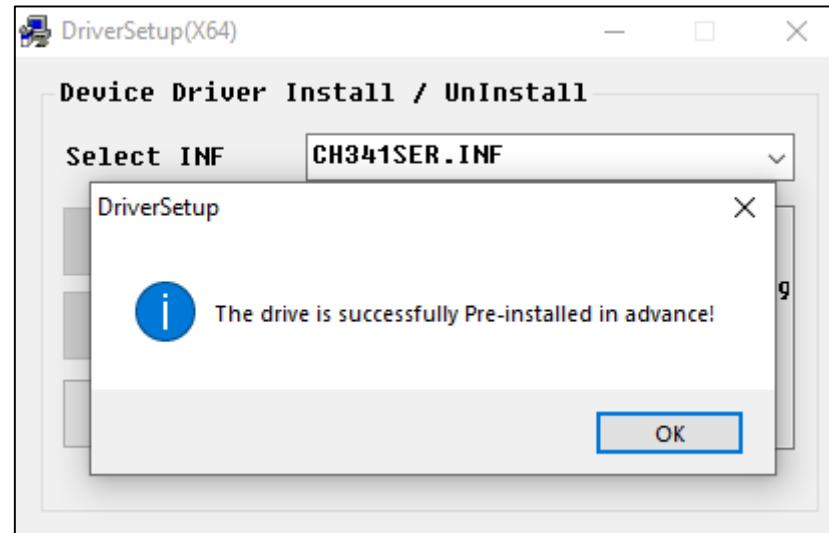

3. Double click “CH341SER.EXE”.

4. Click “INSTALL” and wait for the installation to complete.

5. Install successfully. Close all interfaces.

6. When ESP32 is connected to computer, select "This PC", right-click to select "Manage" and click "Device Manager" in the newly pop-up dialog box, and you can see the following interface.

7. So far, CH340 has been installed successfully. Close all dialog boxes.

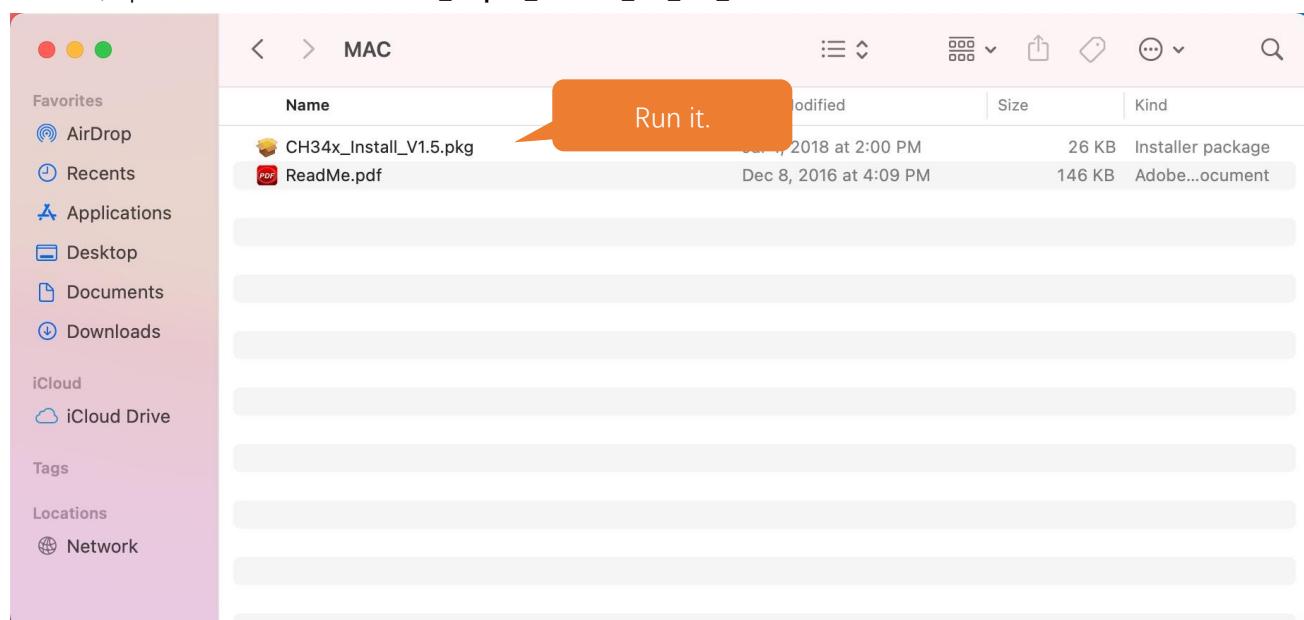

MAC

First, download CH340 driver, click <http://www.wch-ic.com/search?q=CH340&t=downloads> to download the appropriate one based on your operating system.

The screenshot shows a search results page for 'ch340' on the WCH website. The left sidebar has categories: All (14), Downloads (7), Products (4), Application (2), Video (1), and News (0). The main area shows a table of results under 'Downloads(7)'. The columns are file category, file content, version, and upload time. The results are as follows:

file category	file content	version	upload time
Driver&Tools	Windows CH341SER.EXE CH340/CH341 USB to serial port Windows driver, supports 32/64-bit Windows 10/8.1/8/7/VISTA/XP, Server 2016/2012/2008/2003, 2000/ME/98	3.5	2019-03-18
	CH341SER.ZIP CH340/CH341 USB to serial port Windows driver, includes DLL dynamic library and non-standard baud rate settings and other instructions. Supports 32/64-bit Windows 10/8.1/8/7/VISTA/XP, Server 2016/2012/2008/2003, 2000/ME/98	3.5	2019-03-05
	CH341SER_ANDROID... CH340/CH341 USB to serial port Android free drive application library, for Android OS 3.1 and above version which supports USB Host mode already, no need to load Android kernel driver, no root privileges. Contains apk, lib library file (Java Driver), App Demo Examples, and FTDI Demo SDK.	1.6	2019-04-19
	CH341SER_LINUX... CH340/CH341 USB to serial port LINUX driver	1.5	2018-03-18
	CH341SER_MAC.ZI... CH340/CH341 USB to serial port MAC OS driver	1.5	2018-07-05
Others			

If you would not like to download the installation package, you can open "Freenove_Super_Starter_Kit_for_ESP32/CH340", we have prepared the installation package. Second, open the folder "Freenove_Super_Starter_Kit_for_ESP32/CH340/MAC/"

Third, click Continue.

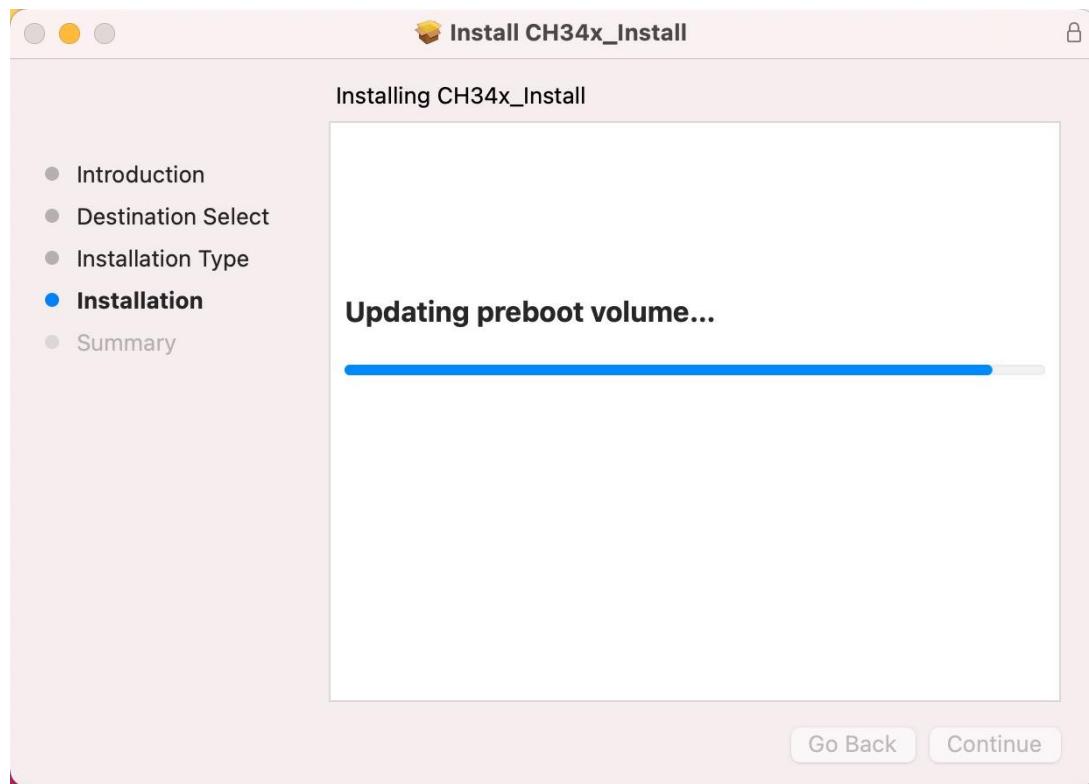

Fourth, click Install.

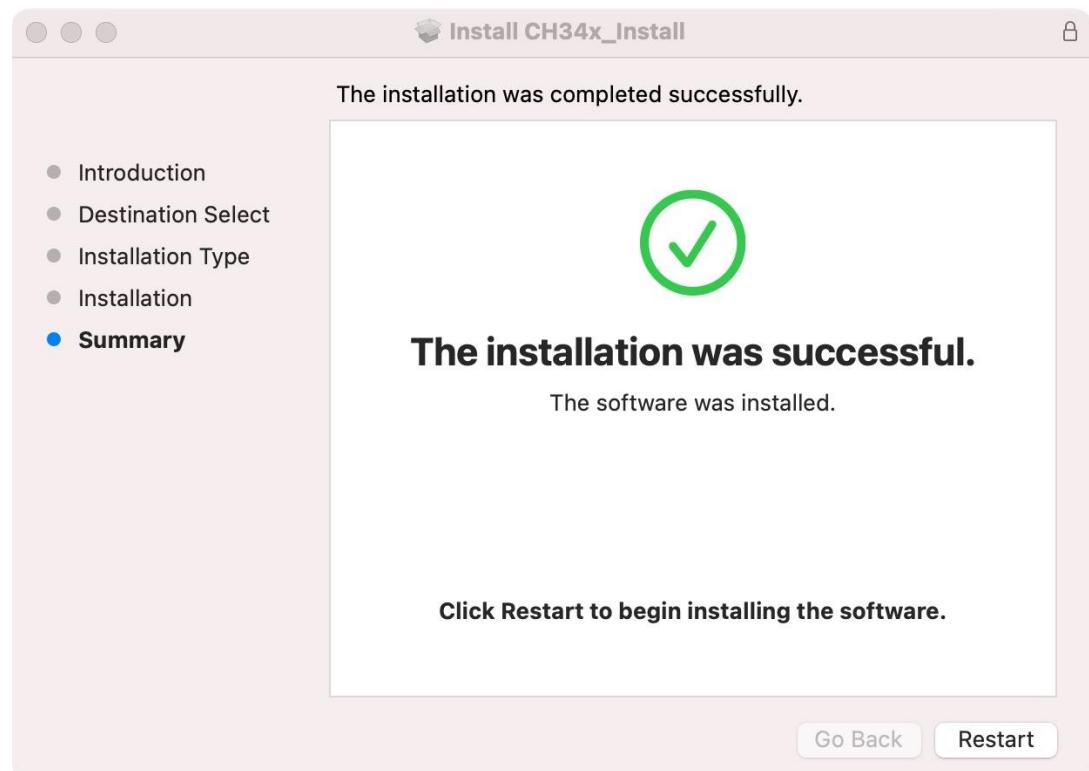

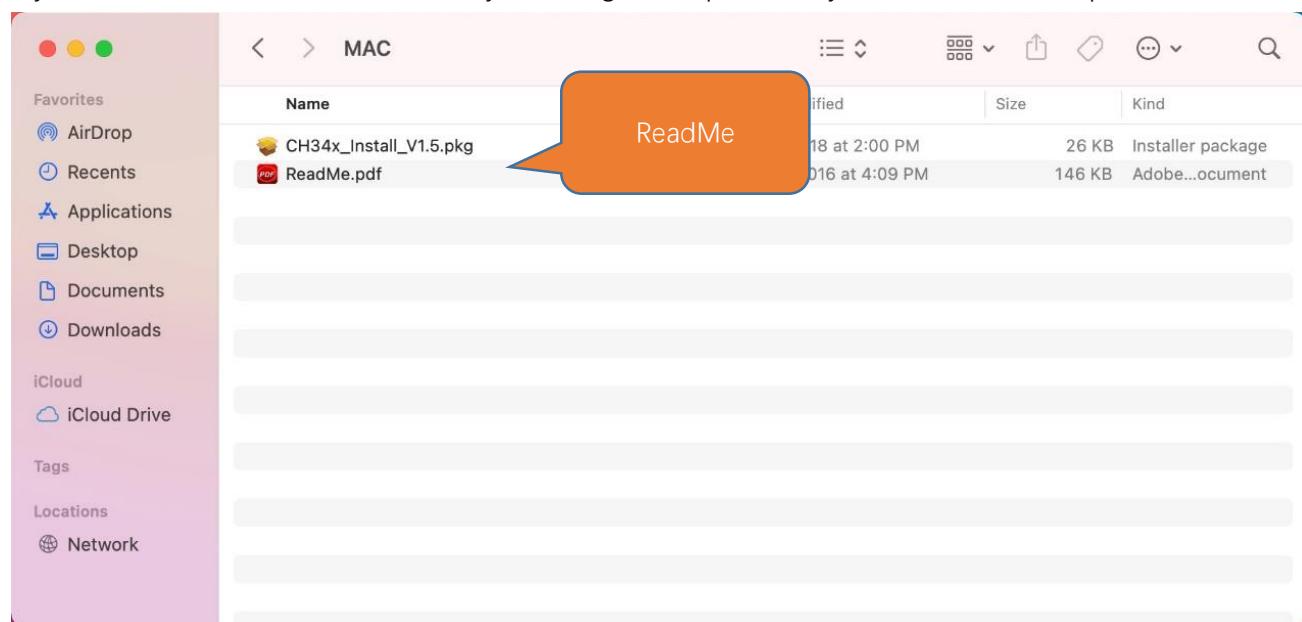

Then, waiting Finsh.

Finally, restart your PC.

If you still haven't installed the CH340 by following the steps above, you can view `readme.pdf` to install it.

Programming Software

Arduino Software (IDE) is used to write and upload the code for Arduino Board.

First, install Arduino Software (IDE): visit <https://www.arduino.cc>, click "Download" to enter the download page.

Select and download corresponding installer according to your operating system. If you are a windows user, please select the "Windows Installer" to download to install the driver correctly.

Download the Arduino IDE

ARDUINO 1.8.12

The open-source Arduino Software (IDE) makes it easy to write code and upload it to the board. It runs on Windows, Mac OS X, and Linux. The environment is written in Java and based on Processing and other open-source software.

This software can be used with any Arduino board. Refer to the [Getting Started](#) page for installation instructions.

→

Windows Installer, for Windows XP and up
Windows ZIP file for non admin install

Windows app Requires Win 8.1 or 10
[Get](#)

Mac OS X 10.8 Mountain Lion or newer

Linux 32 bits
Linux 64 bits
Linux ARM 32 bits
Linux ARM 64 bits

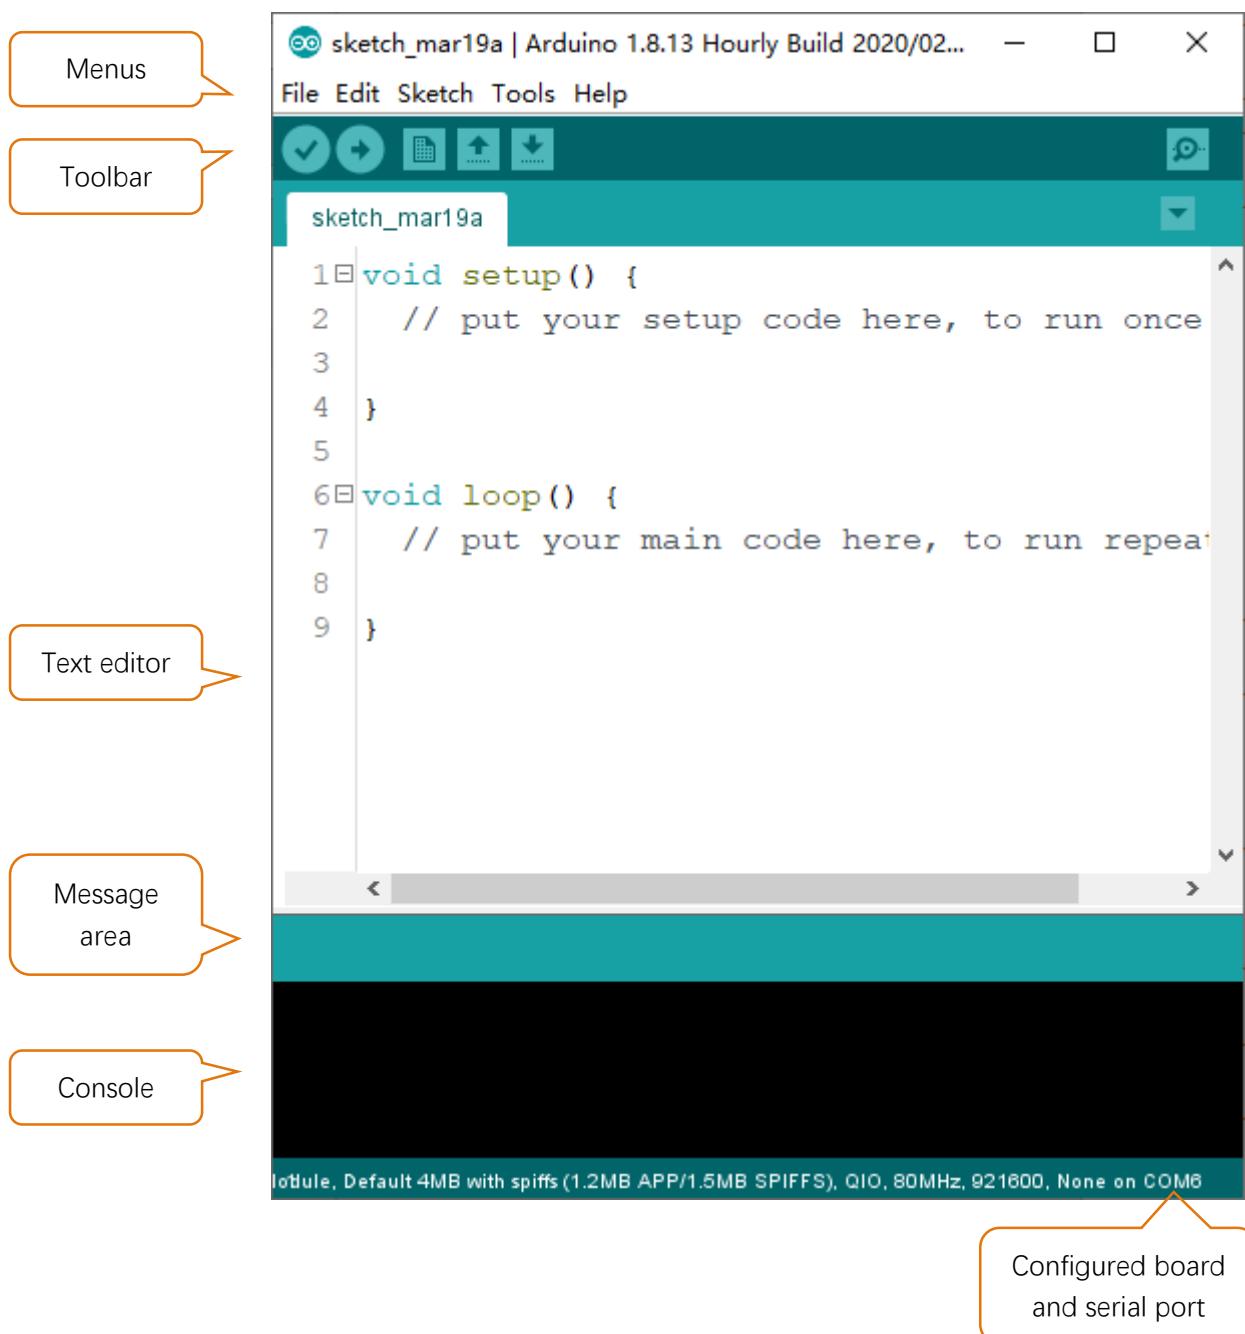

[Release Notes](#)
[Source Code](#)
[Checksums \(sha512\)](#)

After the download completes, run the installer. For Windows users, there may pop up an installation dialog box of driver during the installation process. When it popes up, please allow the installation.

After installation is complete, an Arduino Software shortcut will be generated in the desktop. Run the Arduino Software.

The interface of Arduino Software is as follows:

Programs written with Arduino Software (IDE) are called **sketches**. These sketches are written in the text editor and saved with the file extension.**.ino**. The editor has features for cutting/pasting and searching/replacing text. The message area gives feedback while saving and exporting and also displays errors. The console displays text output by the Arduino Software (IDE), including complete error messages and other information. The bottom right-hand corner of the window displays the configured board and serial port. The toolbar buttons allow you to verify and upload programs, create, open, and save sketches, and open the serial monitor.

Verify

Check your code for compile errors .

Upload

Compile your code and upload them to the configured board.

New

Create a new sketch.

Open

Present a menu of all the sketches in your sketchbook. Clicking one will open it within the current window and overwrite its content.

Save

Save your sketch.

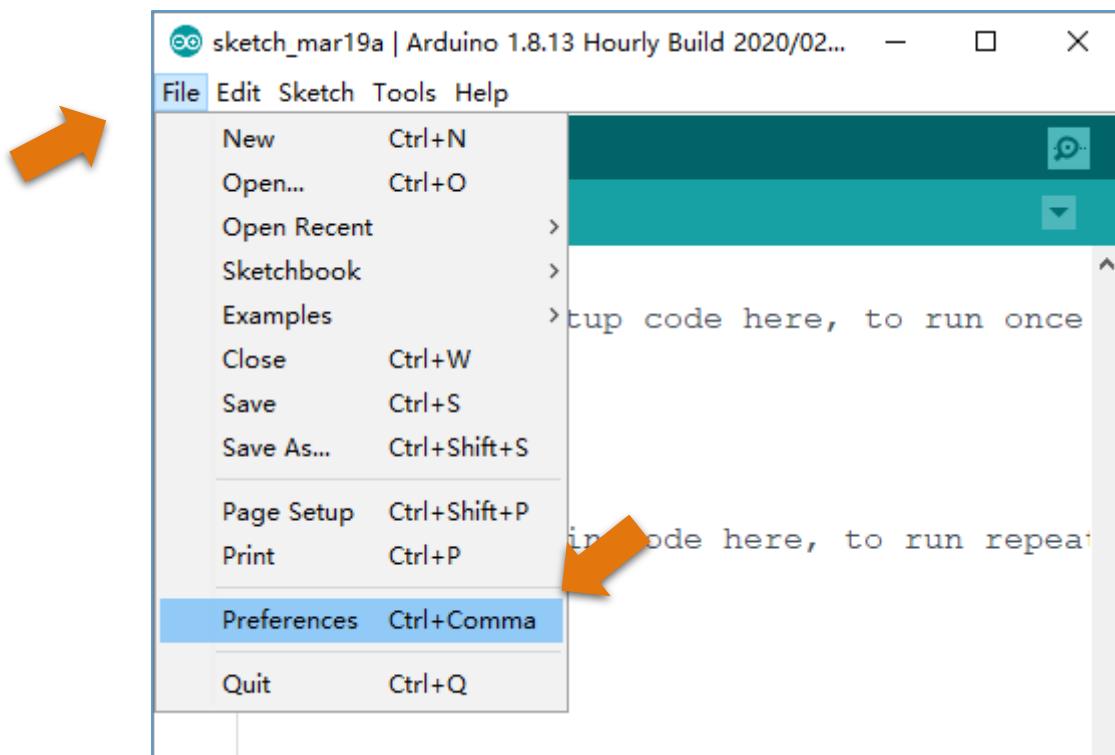

Serial Monitor

Open the serial monitor.

Additional commands are found within the five menus: File, Edit, Sketch, Tools, Help. The menus are context sensitive, which means only those items relevant to the work currently being carried out are available.

Environment Configuration

First, open the software platform arduino, and then click File in Menus and select Preferences.

Second, click on the symbol behind "Additional Boards Manager URLs"

Third, fill in https://raw.githubusercontent.com/espressif/arduino-esp32/gh-pages/package_esp32_index.json in the new window, click OK, and click OK on the Preferences window again.

Fourth, click Tools in Menus, select Board:"ArduinoUno", and then select "Boards Manager".

Fifth, input "esp32" in the window below, and press Enter. click "Install" to install.

When finishing installation, click Tools in the Menus again and select Board: "Arduino Uno", and then you can see information of ESP32-WROVER. click "ESP32-WROVER" so that the ESP32 programming development environment is configured.

Notes for GPIO

Strapping Pin

There are five Strapping pins for ESP32: MTDI、GPIO0、GPIO2、MTDO、GPIO5.

With the release of the chip's system reset (power-on reset, RTC watchdog reset, undervoltage reset), the strapping pins sample the level and store it in the latch as "0" or "1", and keep it until the chip is powered off or turned off.

Each Strapping pin is connecting to internal pull-up/pull-down. Connecting to high-impedance external circuit or without an external connection, a strapping pin's default value of input level will be determined by internal weak pull-up/pull-down. To change the value of the Strapping, users can apply an external pull-down/pull-up resistor, or use the GPIO of the host MCU to control the level of the strapping pin when the ESP32's power on reset is released.

When releasing the reset, the strapping pin has the same function as a normal pin.

The followings are default configurations of these five strapping pins at power-on and their functions under the corresponding configuration.

Voltage of Internal LDO (VDD_SDIO)					
Pin	Default	3.3 V	1.8 V		
MTDI	Pull-down	0	1		
Booting Mode					
Pin	Default	SPI Boot	Download Boot		
GPIO0	Pull-up	1	0		
GPIO2	Pull-down	Don't-care	0		
Enabling/Disabling Debugging Log Print over U0TXD During Booting					
Pin	Default	U0TXD Active	U0TXD Silent		
MTDO	Pull-up	1	0		
Timing of SDIO Slave					
Pin	Default	Falling-edge Sampling Falling-edge Output	Falling-edge Sampling Rising-edge Output	Rising-edge Sampling Falling-edge Output	Rising-edge Sampling Rising-edge Output
MTDO	Pull-up	0	0	1	1
GPIO5	Pull-up	0	1	0	1

Note:

- Firmware can configure register bits to change the settings of "Voltage of Internal LDO (VDD_SDIO)" and "Timing of SDIO Slave" after booting.
- The MTDI is internally pulled high in the module, as the flash and SRAM in ESP32-WROVER only support a power voltage of 1.8 V (output by VDD_SDIO).

If you have any questions about the information of GPIO, you can click [here](#) to go back to ESP32-WROVER to view specific information about GPIO.

If you have any difficulties or questions with this tutorial or toolkit, feel free to ask for our quick and free technical support through support@freenove.com at any time.

or check: https://www.espressif.com/sites/default/files/documentation/esp32-wrover_datasheet_en.pdf

Any concerns? ✉ support@freenove.com

Flash Pin

GPIO6-11 has been used to connect the integrated SPI flash on the module, and is used when GPIO 0 is power on and at high level. Flash is related to the operation of the whole chip, so the external pin GPIO6-11 cannot be used as an experimental pin for external circuits, otherwise it may cause errors in the operation of the program.

GPIO16-17 has been used to connect the integrated PSRAM on the module.

Because of external pull-up, MTDI pin is not suggested to be used as a touch sensor. For details, please refer to Peripheral Interface and Sensor chapter in "ESP32 Data_Sheet".

For more relevant information, please check:

https://www.espressif.com/sites/default/files/documentation/esp32-wrover_datasheet_en.pdf.

Cam Pin

When using the camera of our ESP32-WROVER, please check the pins of it. Pins with underlined numbers are used by the camera function, if you want to use other functions besides it, please avoid using them.

CAM_Pin	GPIO_pin
I2C_SDA	GPIO26
I2C_SCL	GPIO27
CSI_VSYNC	GPIO25
CSI_HREF	GPIO23
CSI_Y9	GPIO35
XCLK	GPIO21
CSI_Y8	GPIO34
CSI_Y7	GPIO39
CSI_PCLK	GPIO22
CSI_Y6	GPIO36
CSI_Y2	GPIO4
CSI_Y5	GPIO19
CSI_Y3	GPIO5
CSI_Y4	GPIO18

If you have any questions about the information of GPIO, you can click [here](#) to go back to ESP32-WROVER to view specific information about GPIO.

or check: https://www.espressif.com/sites/default/files/documentation/esp32-wrover_datasheet_en.pdf.

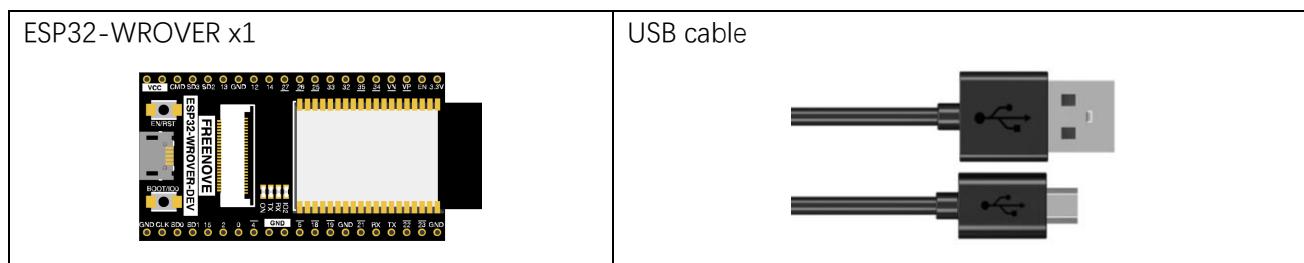

Chapter 0 LED

This chapter is the Start Point in the journey to build and explore ESP32 electronic projects. We will start with simple “Blink” project.

Project 0.1 Blink

In this project, we will use ESP32 to control blinking a common LED.

Component List

Power

ESP32-WROVER needs 5v power supply. In this tutorial, we need connect ESP32-WROVER to computer via USB cable to power it and program it. We can also use other 5v power source to power it.

In the following projects, we only use USB cable to power ESP32-WROVER by default.

In the whole tutorial, we don't use T extension to power ESP32-WROVER. So 5V and 3.3V (including EXT 3.3V) on the extension board are provided by ESP32-WROVER.

We can also use DC jack of extension board to power ESP32-WROVER. In this way, 5v and EXT 3.3v on extension board are provided by external power resource.

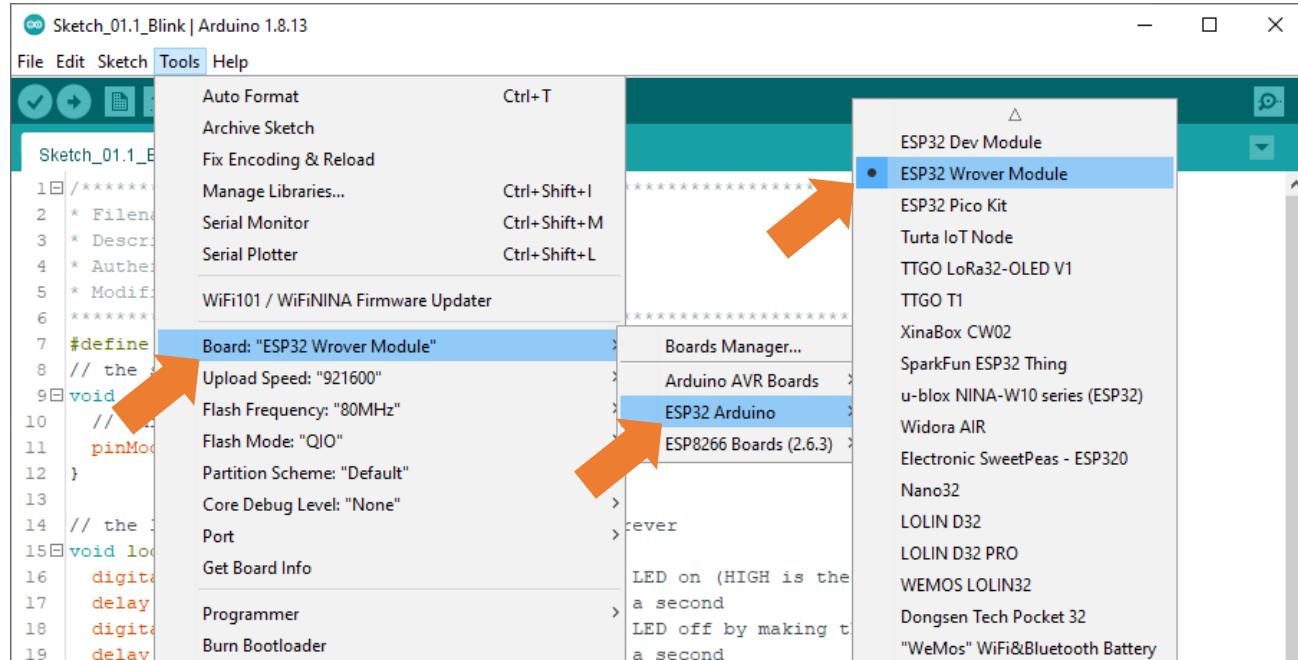

Sketch

According to the circuit, when the GPIO2 of ESP32-WROVER output level is high, the LED turns ON. Conversely, when the GPIO2 ESP32-WROVER output level is low, the LED turns OFF. Therefore, we can let GPIO2 circularly output high and low level to make the LED blink.

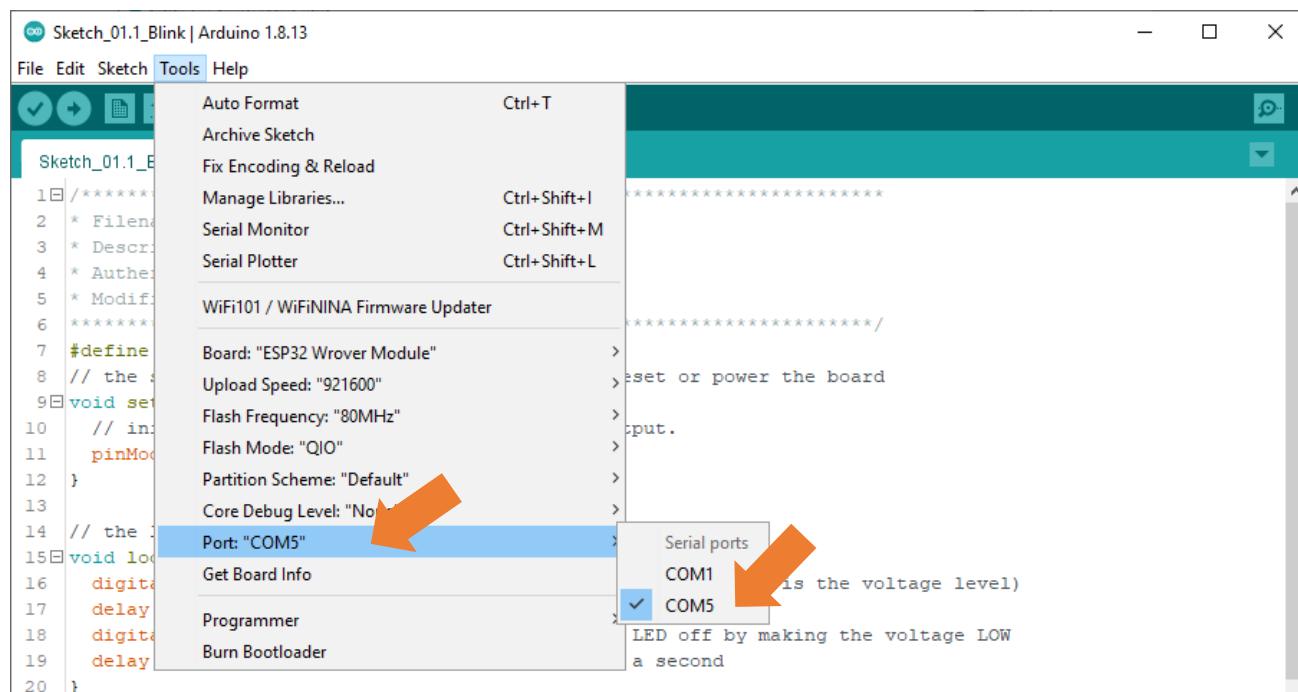

Upload the following Sketch:

Freenove_Super_Starter_Kit_for_ESP32\Sketches\Sketch_01.1_Blink.

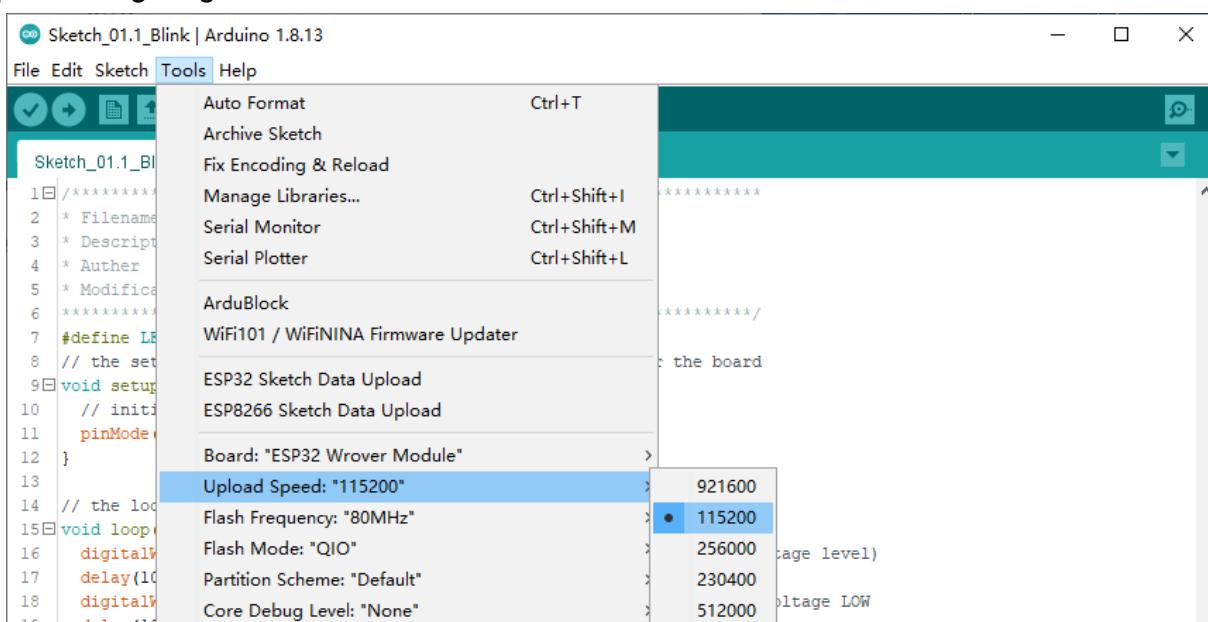

Before uploading the code, click "Tools", "Board" and select "ESP32 Wrover Module".

Select the serial port.

Note: For macOS users, if the uploading fails, please set the baud rate to 115200 before clicking "Upload Using Programmer".

Sketch_01.1_Blink

Click "Upload", Download the code to ESP32-WROVER and your LED in the circuit starts Blink.

If you have any concerns, please contact us via: support@freenove.com

Any concerns? ✉ support@freenove.com

The following is the program code:

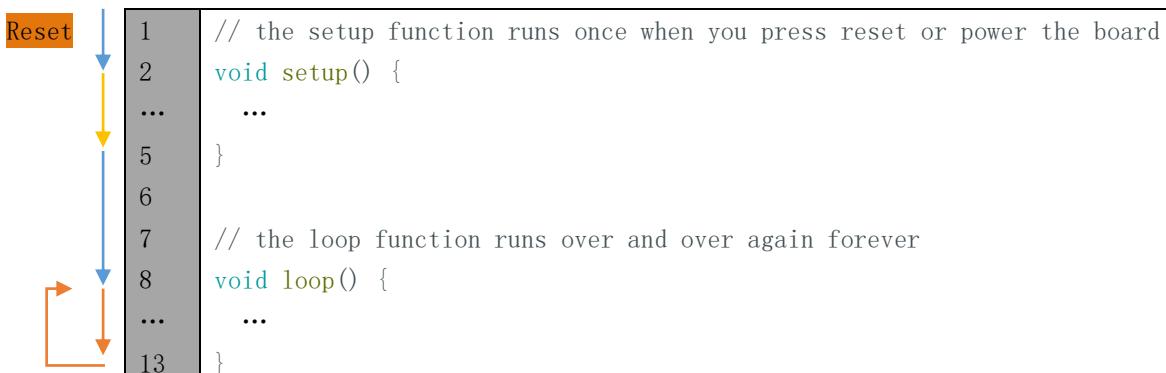

```

1 #define PIN_LED 2
2 // the setup function runs once when you press reset or power the board
3 void setup() {
4     // initialize digital pin LED_BUILTIN as an output.
5     pinMode(PIN_LED, OUTPUT);
6 }
7
8 // the loop function runs over and over again forever
9 void loop() {
10    digitalWrite(PIN_LED, HIGH);    // turn the LED on (HIGH is the voltage level)
11    delay(1000);                  // wait for a second
12    digitalWrite(PIN_LED, LOW);    // turn the LED off by making the voltage LOW
13    delay(1000);                  // wait for a second
14 }
```

The Arduino IDE code usually contains two basic functions: void setup() and void loop().

After the board is reset, the setup() function will be executed firstly, and then the loop() function.

setup() function is generally used to write code to initialize the hardware. And loop() function is used to write code to achieve certain functions. loop() function is executed repeatedly. When the execution reaches the end of loop(), it will jump to the beginning of loop() to run again.

Reset

Reset operation will lead the code to be executed from the beginning. Switching on the power, finishing uploading the code and pressing the reset button will trigger reset operation.

In the circuit, ESP32-WROVER's GPIO2 is connected to the LED, so the LED pin is defined as 2.

```
1 #define PIN_LED 2
```

This means that after this line of code, all PIN_LED will be treated as 2.

In the setup () function, first, we set the PIN_LED as output mode, which can make the port output high level or low level.

```

4 // initialize digital pin PIN_LED as an output.
5 pinMode(PIN_LED, OUTPUT);
```

Then, in the loop () function, set the PIN_LED to output high level to make LED light up.

```
10 digitalWrite(PIN_LED, HIGH); // turn the LED on (HIGH is the voltage level)
```

Wait for 1000ms, that is 1s. Delay () function is used to make control board wait for a moment before executing the next statement. The parameter indicates the number of milliseconds to wait for.

```
11   delay(1000);           // wait for a second
```

Then set the PIN_LED to output low level, and LED light off. One second later, the execution of loop () function will be completed.

```
12   digitalWrite(PIN_LED, LOW); // turn the LED off by making the voltage LOW
13   delay(1000);           // wait for a second
```

The loop() function is constantly being executed, so LED will keep blinking.

Reference

```
void pinMode(int pin, int mode);
```

Configures the specified pin to behave either as an input or an output.

Parameters

pin: the pin number to set the mode of.

mode: INPUT, OUTPUT, INPUT_PULLDOWN, or INPUT_PULLUP.

```
void digitalWrite (int pin, int value);
```

Writes the value HIGH or LOW (1 or 0) to the given pin which must have been previously set as an output.

For more related functions, please refer to <https://www.arduino.cc/reference/en/>

Chapter 1 LED

This chapter is the Start Point in the journey to build and explore ESP32 electronic projects. We will start with simple “Blink” project.

Project 1.1 Blink

In this project, we will use ESP32 to control blinking a common LED.

Component List

ESP32-WROVER x1	GPIO Extension Board x1	
		
Breadboard x1		
LED x1	Resistor 220Ω x1	Jumper M/M x2
		

Component knowledge

LED

A LED is a type of diode. All diodes only work if current is flowing in the correct direction and have two poles. A LED will only work (light up) if the longer pin (+) of LED is connected to the positive output from a power source and the shorter pin is connected to the negative (-). Negative output is also referred to as Ground (GND). This type of component is known as “diodes” (think One-Way Street).

All common 2 lead diodes are the same in this respect. Diodes work only if the voltage of its positive electrode is higher than its negative electrode and there is a narrow range of operating voltage for most all common diodes of 1.9 and 3.4V. If you use much more than 3.3V the LED will be damaged and burn out.

LED	Voltage	Maximum current	Recommended current
Red	1.9 - 2.2V	20mA	10mA
Green	2.9 - 3.4V	10mA	5mA
Blue	2.9 - 3.4V	10mA	5mA
Volt ampere characteristics conform to diode			

Note: LEDs cannot be directly connected to a power supply, which usually ends in a damaged component. A resistor with a specified resistance value must be connected in series to the LED you plan to use.

Resistor

Resistors use Ohms (Ω) as the unit of measurement of their resistance (R). $1M\Omega=1000k\Omega$, $1k\Omega=1000\Omega$.

A resistor is a passive electrical component that limits or regulates the flow of current in an electronic circuit. On the left, we see a physical representation of a resistor, and the right is the symbol used to represent the presence of a resistor in a circuit diagram or schematic.

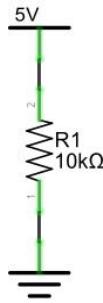

The bands of color on a resistor is a shorthand code used to identify its resistance value. For more details of resistor color codes, please refer to the appendix of this tutorial.

With a fixed voltage, there will be less current output with greater resistance added to the circuit. The relationship between Current, Voltage and Resistance can be expressed by this formula: $I=V/R$ known as Ohm's Law where I = Current, V = Voltage and R = Resistance. Knowing the values of any two of these allows you to solve the value of the third.

In the following diagram, the current through R1 is: $I=U/R=5V/10k\Omega=0.0005A=0.5mA$.

Any concerns? ✉ support@freenove.com

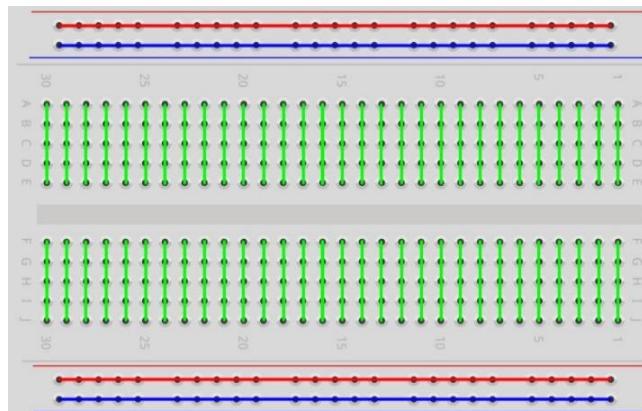

WARNING: Never connect the two poles of a power supply with anything of low resistance value (i.e. a metal object or bare wire) this is a Short and results in high current that may damage the power supply and electronic components.

Note: Unlike LEDs and diodes, resistors have no poles and are non-polar (it does not matter which direction you insert them into a circuit, it will work the same)

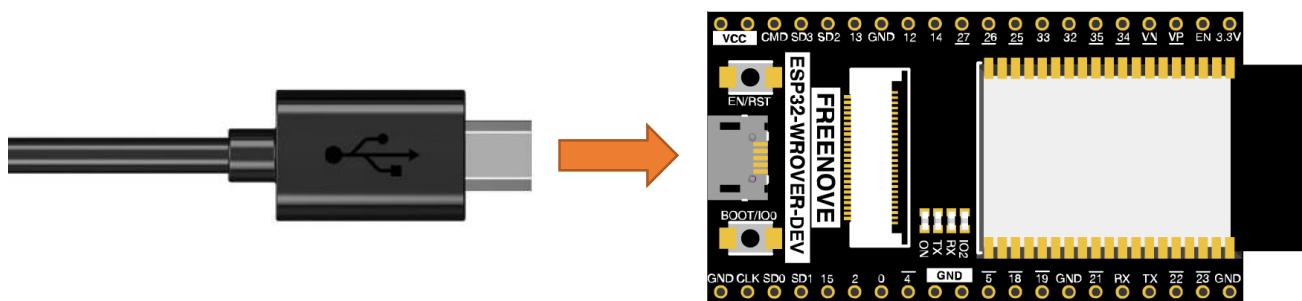

Breadboard

Here we have a small breadboard as an example of how the rows of holes (sockets) are electrically attached. The left picture shows the way to connect pins. The right picture shows the practical internal structure.

Power

ESP32-WROVER needs 5v power supply. In this tutorial, we need connect ESP32-WROVER to computer via USB cable to power it and program it. We can also use other 5v power source to power it.

In the following projects, we only use USB cable to power ESP32-WROVER by default.

In the whole tutorial, we don't use T extension to power ESP32-WROVER. So 5V and 3.3V (including EXT 3.3V) on the extension board are provided by ESP32-WROVER.

We can also use DC jack of extension board to power ESP32-WROVER. In this way, 5v and EXT 3.3v on extension board are provided by external power resource.

Circuit

First, disconnect all power from the ESP32-WROVER. Then build the circuit according to the circuit and hardware diagrams. After the circuit is built and verified correct, connect the PC to ESP32-WROVER.

CAUTION: Avoid any possible short circuits (especially connecting 5V or GND, 3.3V and GND)! **WARNING:** A short circuit can cause high current in your circuit, generate excessive component heat and cause permanent damage to your hardware!

Schematic diagram

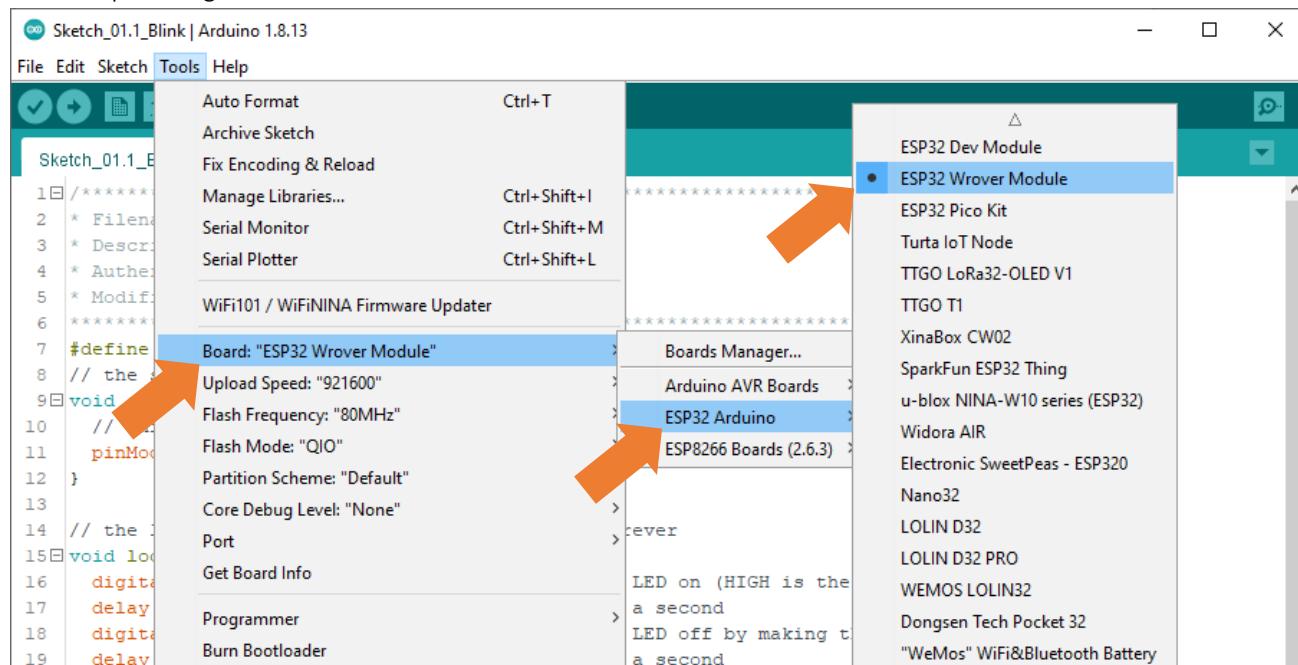

Sketch

According to the circuit, when the GPIO2 of ESP32-WROVER output level is high, the LED turns ON. Conversely, when the GPIO2 ESP32-WROVER output level is low, the LED turns OFF. Therefore, we can let GPIO2 circularly output high and low level to make the LED blink.

Upload the following Sketch:

Freenove_Super_Starter_Kit_for_ESP32\Sketches\Sketch_01.1_Blink.

Before uploading the code, click "Tools", "Board" and select "ESP32 Wrover Module".

Select the serial port.

Note: For macOS users, if the uploading fails, please set the baud rate to 115200 before clicking “Upload Using Programmer”.

Sketch_01.1_Blink

Click “Upload”, Download the code to ESP32-WROVER and your LED in the circuit starts Blink.

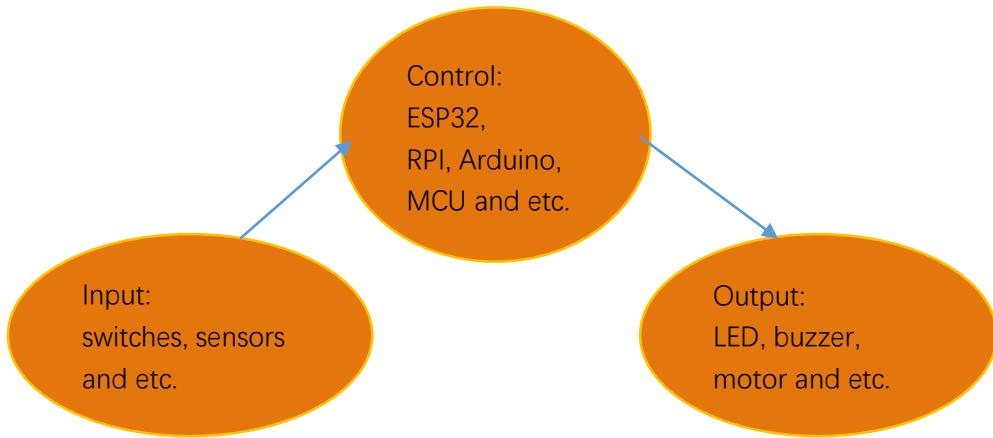

If you have any concerns, please contact us via: support@freenove.com

Any concerns? ✉ support@freenove.com

Chapter 2 Button & LED

Usually, there are three essential parts in a complete automatic control device: INPUT, OUTPUT, and CONTROL. In last section, the LED module was the output part and ESP32 was the control part. In practical applications, we not only make LEDs flash, but also make a device sense the surrounding environment, receive instructions and then take the appropriate action such as LEDs light up, make a buzzer turn ON and so on.

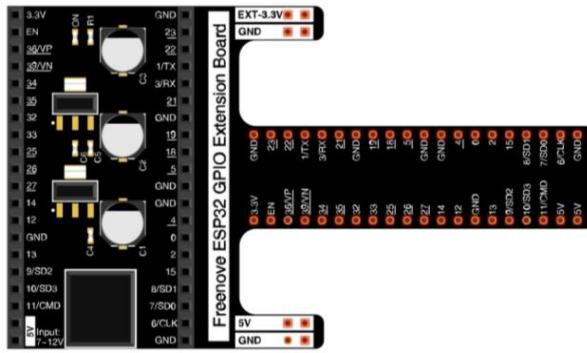

Next, we will build a simple control system to control a LED through a push button switch.

Project 2.1 Button & LED

In the project, we will control the LED state through a Push Button Switch. When the button is pressed, our LED will turn ON, and when it is released, the LED will turn OFF.

Component List

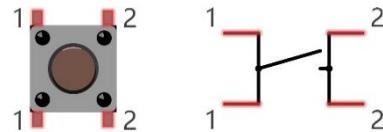

ESP32-WROVER x1	GPIO Extension Board x1			
				
Breadboard x1				
Jumper M/M x4	LED x1	Resistor 220Ω x1	Resistor 10kΩ x2	Push button x1
				

Component knowledge

Push button

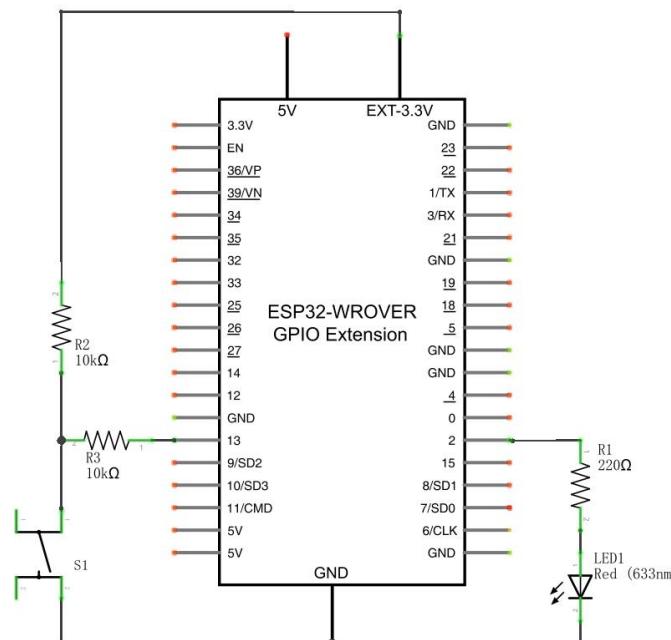

This type of push button switch has 4 pins (2 Pole Switch). Two pins on the left are connected, and both left and right sides are the same per the illustration:

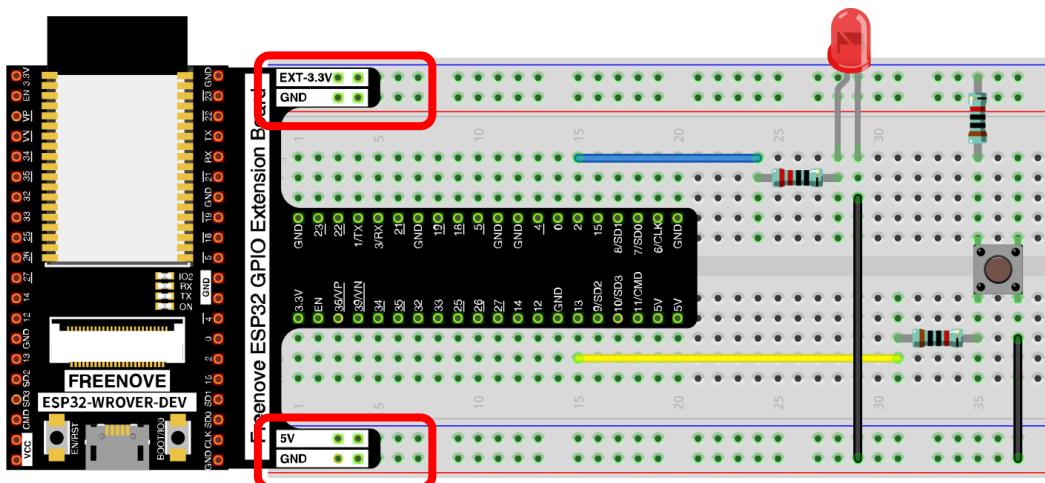

When the button on the switch is pressed, the circuit is completed (your project is powered ON).

Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: support@freenove.com

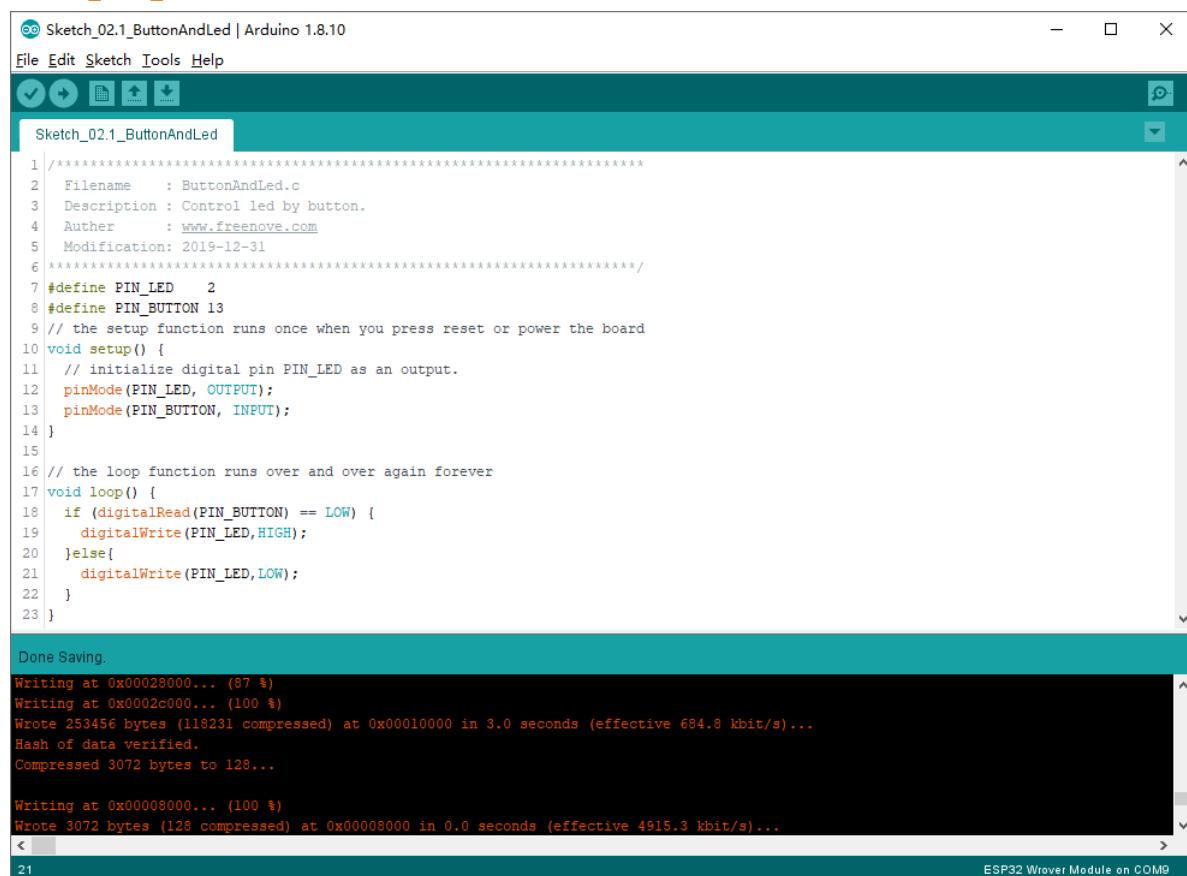

Any concerns? [✉ support@freenove.com](mailto:support@freenove.com)

Sketch

This project is designed for learning how to use push button switch to control a LED. We first need to read the state of switch, and then determine whether to turn the LED ON in accordance to the state of the switch. Upload following sketch:

Freenove_Super_Starter_Kit_for_ESP32\Sketches\Sketch_02.1_ButtonAndLed.

Sketch_02.1_ButtonAndLed

ESP32 Wrover Module on COM9

```

Download the code to ESP32-WROVER, then press the key, the LED turns ON, release the switch, the LED turns OFF.

If you have any concerns, please contact us via: support@freenove.com

Any concerns? ✉ support@freenove.com

The following is the program code:

```

1 #define PIN_LED    2
2 #define PIN_BUTTON 13
3 // the setup function runs once when you press reset or power the board
4 void setup() {
5     // initialize digital pin PIN_LED as an output.
6     pinMode(PIN_LED, OUTPUT);
7     pinMode(PIN_BUTTON, INPUT);
8 }
9
10 // the loop function runs over and over again forever
11 void loop() {
12     if (digitalRead(PIN_BUTTON) == LOW) {
13         digitalWrite(PIN_LED, HIGH);
14     }else{
15         digitalWrite(PIN_LED, LOW);
16     }
17 }
```

In the circuit connection, LED and button are connected with GPIO2 and GPIO13 respectively, so define ledPin and buttonPin as 2 and 13 respectively.

```

1 #define PIN_LED    2
2 #define PIN_BUTTON 13
```

In the while cycle of main function, use digitalRead(buttonPin) to determine the state of button. When the button is pressed, the function returns low level, the result of "if" is true, and then turn on LED. Otherwise, turn off LED.

```

11 void loop() {
12     if (digitalRead(PIN_BUTTON) == LOW) {
13         digitalWrite(PIN_LED, HIGH);
14     }else{
15         digitalWrite(PIN_LED, LOW);
16     }
17 }
```

Reference

```
int digitalRead (int pin);
```

This function returns the value read at the given pin. It will be "HIGH" or "LOW"(1 or 0) depending on the logic level at the pin.

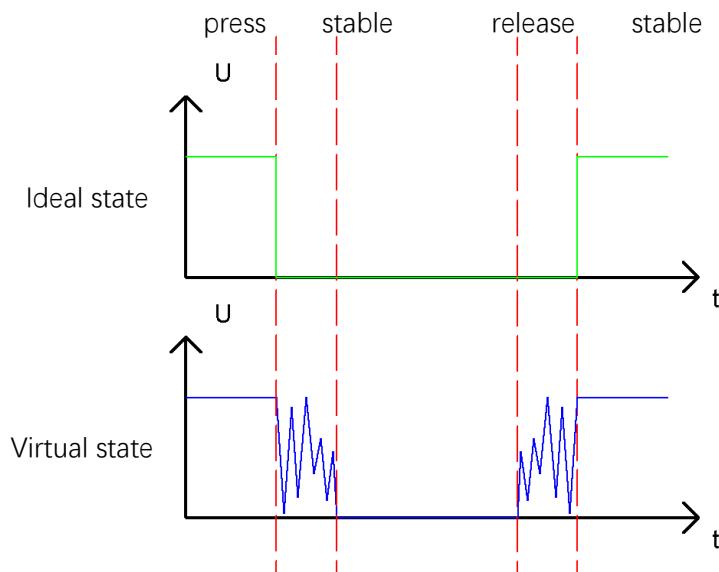

Project 2.2 MINI table lamp

We will also use a push button switch, LED and ESP32 to make a MINI table lamp but this will function differently: Press the button, the LED will turn ON, and pressing the button again, the LED turns OFF. The ON switch action is no longer momentary (like a door bell) but remains ON without needing to continually press on the Button Switch.

First, let us learn something about the push button switch.

Debounce for Push Button

The moment when a push button switch is pressed, it will not change from one state to another state immediately. Due to tiny mechanical vibrations, there will be a short period of continuous buffeting before it completely reaches another state too fast for humans to detect but not for computer microcontrollers. The same is true when the push button switch is released. This unwanted phenomenon is known as "bounce".

Therefore, if we can directly detect the state of the push button switch, there are multiple pressing and releasing actions in one pressing cycle. This buffeting will mislead the high-speed operation of the microcontroller to cause many false decisions. Therefore, we need to eliminate the impact of buffeting. Our solution: to judge the state of the button multiple times. Only when the button state is stable (consistent) over a period of time, can it indicate that the button is actually in the ON state (being pressed).

This project needs the same components and circuits as we used in the previous section.

Sketch

Sketch_02.2_Tablelamp

```
Sketch_02.2_TableLamp | Arduino 1.8.10

ESP32 Wrover Module on COM9
```

Download the code to the ESP32-WROVER, press the button, the LED turns ON, and press the button again, the LED turns OFF.

If you have any concerns, please contact us via: support@freenove.com

Any concerns? ✉ support@freenove.com

The following is the program code:

```

1 #define PIN_LED    2
2 #define PIN_BUTTON 13
3 // the setup function runs once when you press reset or power the board
4 void setup() {
5     // initialize digital pin PIN_LED as an output.
6     pinMode(PIN_LED, OUTPUT);
7     pinMode(PIN_BUTTON, INPUT);
8 }
9
10 // the loop function runs over and over again forever
11 void loop() {
12     if (digitalRead(PIN_BUTTON) == LOW) {
13         delay(20);
14         if (digitalRead(PIN_BUTTON) == LOW) {
15             reverseGPIO(PIN_LED);
16         }
17         while (digitalRead(PIN_BUTTON) == LOW);
18         delay(20);
19         while (digitalRead(PIN_BUTTON) == LOW);
20     }
21 }
22
23 void reverseGPIO(int pin) {
24     digitalWrite(pin, ! digitalRead(pin));
25 }
```

When judging the push button state, if it is detected as "pressed down", wait for a certain time to detect again to eliminate the effect of bounce. When confirmed, flip the LED on and off. Then it starts to wait for the pressed button to be released, and waits for a certain time to eliminate the effect of bounce after it is released.

```

12 if (digitalRead(PIN_BUTTON) == LOW) {
13     delay(20);
14     if (digitalRead(PIN_BUTTON) == LOW) {
15         reverseGPIO(PIN_LED);
16     }
17     while (digitalRead(PIN_BUTTON) == LOW);
18     delay(20);
19     while (digitalRead(PIN_BUTTON) == LOW);
20 }
```

The subfunction reverseGPIO() means reading the state value of the specified pin, taking the value back and writing it to the pin again to achieve the function of flipping the output state of the pin.

```

23 void reverseGPIO(int pin) {
24     digitalWrite(pin, ! digitalRead(pin));
25 }
```

Chapter 3 LED Bar

We have learned how to control a LED blinking, next we will learn how to control a number of LEDs.

Project 3.1 Flowing Light

In this project, we use a number of LEDs to make a flowing light.

Component List

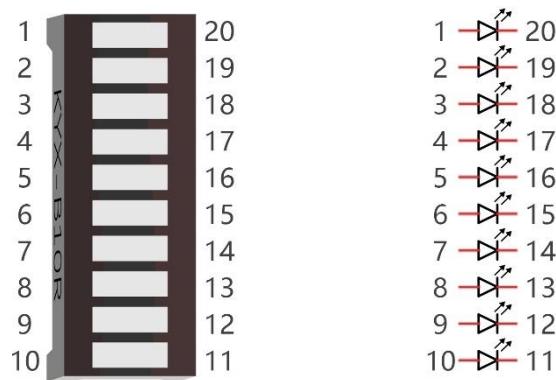

ESP32-WROVER x1	GPIO Extension Board x1	
Breadboard x1		
Jumper M/M x10	LED bar graph x1	Resistor 220Ω x10

Component knowledge

Let's learn about the basic features of these components to use and understand them better.

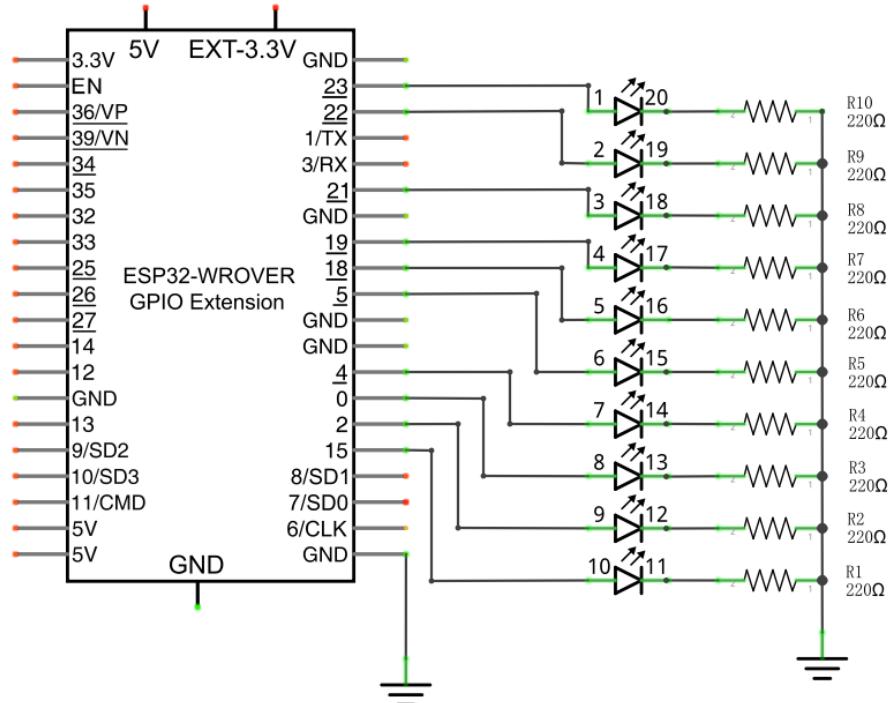

LED bar

A LED bar graph has 10 LEDs integrated into one compact component. The two rows of pins at its bottom are paired to identify each LED like the single LED used earlier.

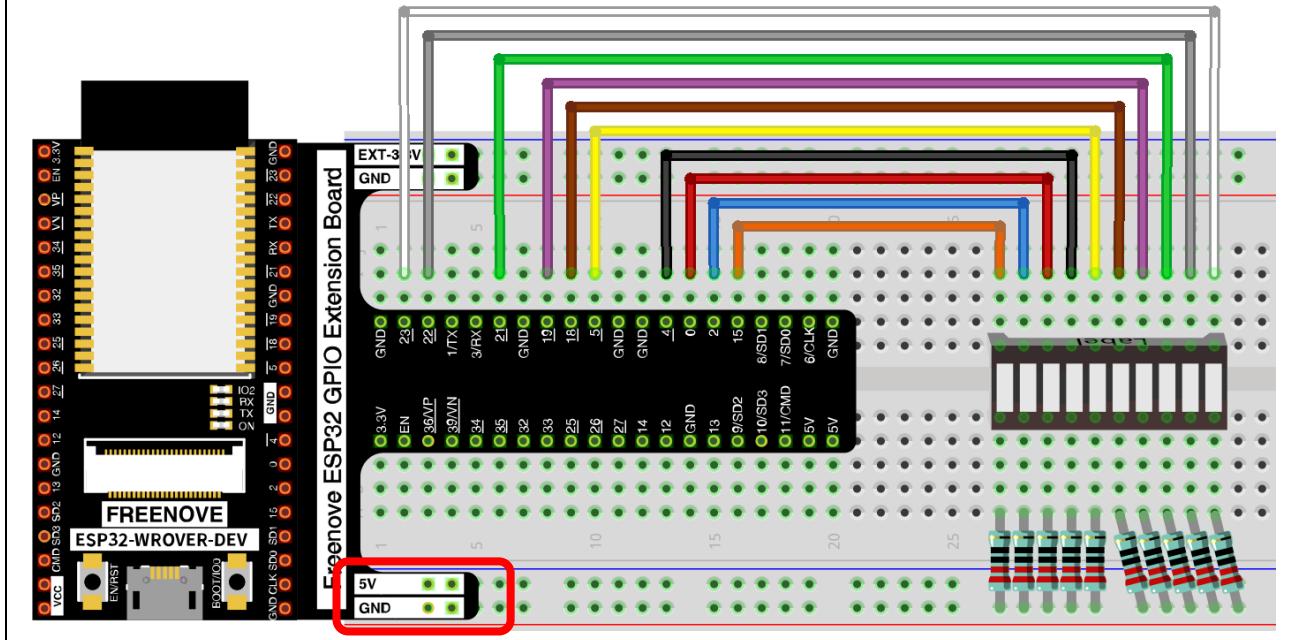

Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: support@freenove.com

If LED bar does not work, try to rotate it for 180°. The label is random.

Any concerns? ✉ support@freenove.com

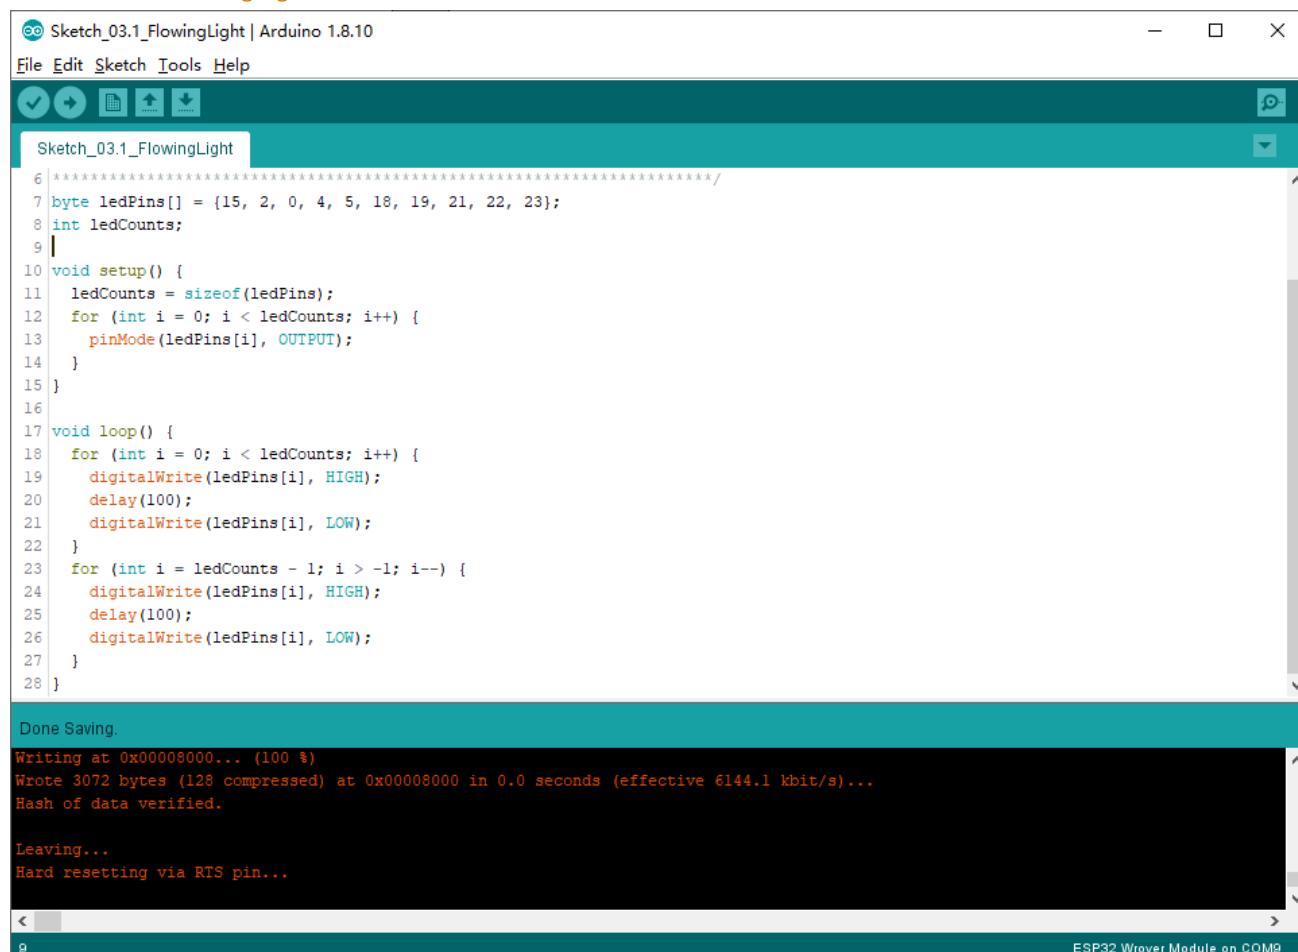

Sketch

This project is designed to make a flowing water lamp. Which are these actions: First turn LED #1 ON, then turn it OFF. Then turn LED #2 ON, and then turn it OFF... and repeat the same to all 10 LEDs until the last LED is turns OFF. This process is repeated to achieve the “movements” of flowing water.

Upload following sketch:

Freenove_Super_Starter_Kit_for_ESP32\Sketches\Sketch_03.1_FlowingLight.

Sketch_03.1_FlowingLight

The screenshot shows the Arduino IDE interface with the following details:

- Title Bar:** Sketch_03.1_FlowingLight | Arduino 1.8.10
- Menu Bar:** File Edit Sketch Tools Help
- Toolbar:** Includes icons for Save, Open, Upload, and Download.
- Code Editor:** Displays the C++ code for the Sketch_03.1_FlowingLight. The code initializes pins 15, 2, 0, 4, 5, 18, 19, 21, 22, and 23 as outputs. It then enters a loop where it alternates between turning each LED on and off in sequence from left to right and back to left.

```
Sketch_03.1_FlowingLight
6 ****
7 byte ledPins[] = {15, 2, 0, 4, 5, 18, 19, 21, 22, 23};
8 int ledCounts;
9 |
10 void setup() {
11   ledCounts = sizeof(ledPins);
12   for (int i = 0; i < ledCounts; i++) {
13     pinMode(ledPins[i], OUTPUT);
14   }
15 }
16
17 void loop() {
18   for (int i = 0; i < ledCounts; i++) {
19     digitalWrite(ledPins[i], HIGH);
20     delay(100);
21     digitalWrite(ledPins[i], LOW);
22   }
23   for (int i = ledCounts - 1; i > -1; i--) {
24     digitalWrite(ledPins[i], HIGH);
25     delay(100);
26     digitalWrite(ledPins[i], LOW);
27   }
28 }
```

- Status Bar:** Shows "Done Saving.", "Writing at 0x00008000... (100 %)", "Wrote 3072 bytes (128 compressed) at 0x00008000 in 0.0 seconds (effective 6144.1 kbit/s)...", "Hash of data verified.", "Leaving...", and "Hard resetting via RTS pin...".
- Bottom Status:** Shows "ESP32 Wrover Module on COM9".

Download the code to ESP32-WROVER and LED bar graph will light up from left to right and from right to left.

If you have any concerns, please contact us via: support@freenove.com

Any concerns? ✉ support@freenove.com

The following is the program code:

```

1 byte ledPins[] = {15, 2, 0, 4, 5, 18, 19, 21, 22, 23};
2 int ledCounts;
3
4 void setup() {
5     ledCounts = sizeof(ledPins);
6     for (int i = 0; i < ledCounts; i++) {
7         pinMode(ledPins[i], OUTPUT);
8     }
9 }
10
11 void loop() {
12     for (int i = 0; i < ledCounts; i++) {
13         digitalWrite(ledPins[i], HIGH);
14         delay(100);
15         digitalWrite(ledPins[i], LOW);
16     }
17     for (int i = ledCounts - 1; i > -1; i--) {
18         digitalWrite(ledPins[i], HIGH);
19         delay(100);
20         digitalWrite(ledPins[i], LOW);
21     }
22 }
```

Use an array to define 10 GPIO ports connected to LED bar graph for easier operation.

```
1 byte ledPins[] = {15, 2, 0, 4, 5, 18, 19, 21, 22, 23};
```

In setup(), use sizeof() to get the number of array, which is the number of LEDs, then configure the GPIO port to output mode.

```

5 ledCounts = sizeof(ledPins);
6 for (int i = 0; i < ledCounts; i++) {
7     pinMode(ledPins[i], OUTPUT);
8 }
```

Then, in loop(), use two “for” loop to realize flowing water light from left to right and from right to left.

```

12 for (int i = 0; i < ledCounts; i++) {
13     digitalWrite(ledPins[i], HIGH);
14     delay(100);
15     digitalWrite(ledPins[i], LOW);
16 }
17 for (int i = ledCounts - 1; i > -1; i--) {
18     digitalWrite(ledPins[i], HIGH);
19     delay(100);
20     digitalWrite(ledPins[i], LOW);
21 }
```

Chapter 4 Analog & PWM

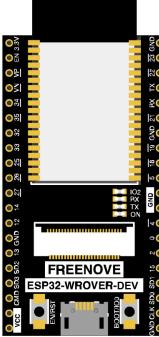

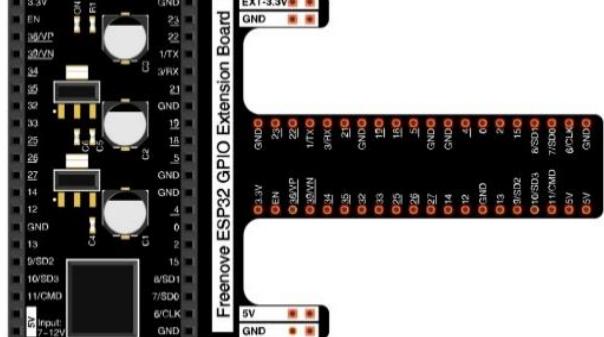

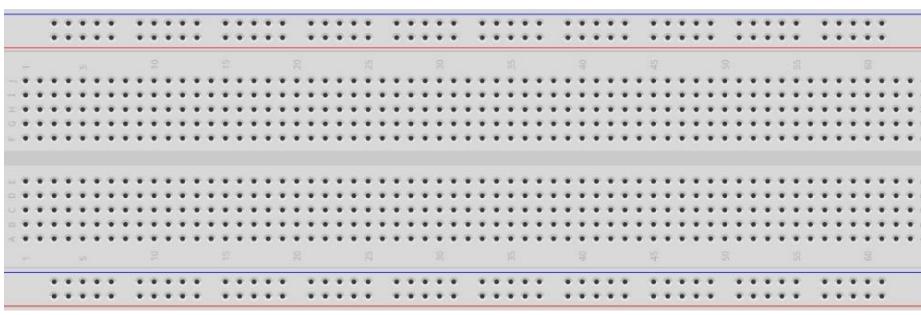

In previous study, we have known that one button has two states: pressed and released, and LED has light-on/off state, then how to enter a middle state? How to output an intermediate state to let LED "semi bright"? That's what we're going to learn.

First, let's learn how to control the brightness of a LED.

Project 4.1 Breathing LED

Breathing light, that is, LED is turned from off to on gradually, and gradually from on to off, just like "breathing". So, how to control the brightness of a LED? We will use PWM to achieve this target.

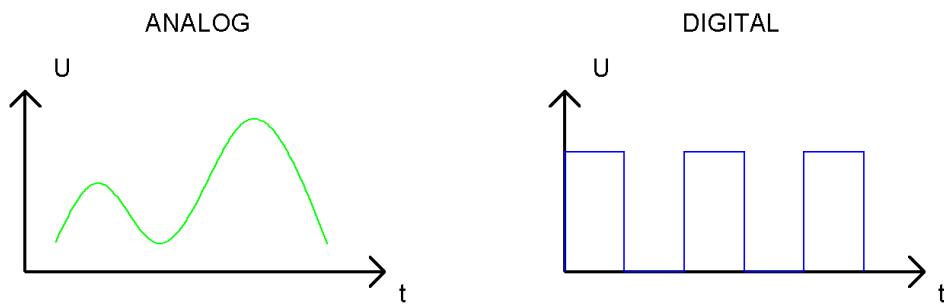

Component List

ESP32-WROVER x1	GPIO Extension Board x1	
		
Breadboard x1		
LED x1	Resistor 220Ω x1	Jumper M/M x2

Related knowledge

Analog & Digital

An analog signal is a continuous signal in both time and value. On the contrary, a digital signal or discrete-time signal is a time series consisting of a sequence of quantities. Most signals in life are analog signals. A familiar example of an analog signal would be how the temperature throughout the day is continuously changing and could not suddenly change instantaneously from 0°C to 10°C. However, digital signals can instantaneously change in value. This change is expressed in numbers as 1 and 0 (the basis of binary code). Their differences can more easily be seen when compared when graphed as below.

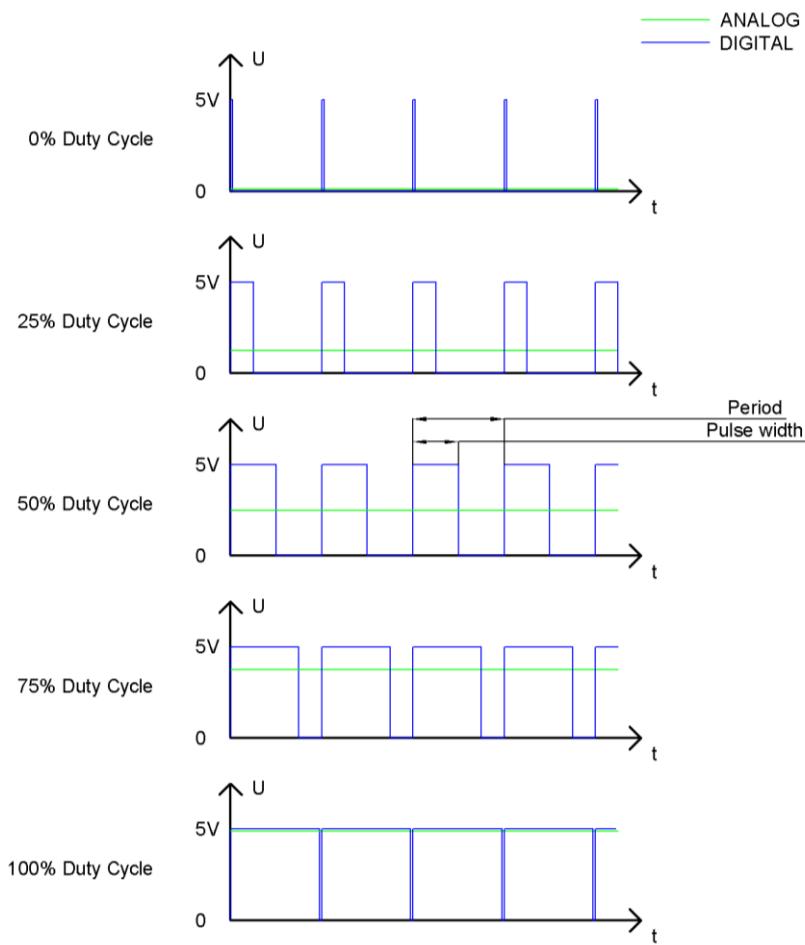

In practical application, we often use binary as the digital signal, that is a series of 0's and 1's. Since a binary signal only has two values (0 or 1), it has great stability and reliability. Lastly, both analog and digital signals can be converted into the other.

PWM

PWM, Pulse-Width Modulation, is a very effective method for using digital signals to control analog circuits. Common processors cannot directly output analog signals. PWM technology makes it very convenient to achieve this conversion (translation of digital to analog signals).

PWM technology uses digital pins to send certain frequencies of square waves, that is, the output of high levels and low levels, which alternately last for a while. The total time for each set of high levels and low levels is generally fixed, which is called the period (Note: the reciprocal of the period is frequency). The time of high level outputs are generally called "pulse width", and the duty cycle is the percentage of the ratio of pulse duration, or pulse width (PW) to the total period (T) of the waveform.

The longer the outputs of high levels last, the longer the duty cycle and the higher the corresponding voltage in the analog signal will be. The following figures show how the analog signal voltages vary between 0V-5V (high level is 5V) corresponding to the pulse width 0%-100%:

The longer the PWM duty cycle is, the higher the output power will be. Now that we understand this relationship, we can use PWM to control the brightness of a LED or the speed of DC motor and so on. It is evident from the above that PWM is not real analog, and the effective value of the voltage is equivalent to the corresponding analog. Therefore, we can control the output power of the LED and other output modules to achieve different effects.

ESP32 and PWM

On ESP32, the LEDC(PWM) controller has 16 separate channels, each of which can independently control frequency, duty cycle, and even accuracy. Unlike traditional PWM pins, the PWM output pins of ESP32 are configurable, with one or more PWM output pins per channel. The relationship between the maximum frequency and bit precision is shown in the following formula, where the maximum value of bit is 31.

$$\text{Freq}_{\max} = \frac{80,000,000}{1 \ll \text{bit}}$$

For example, generate a PWM with an 8-bit precision ($2^8=256$. Values range from 0 to 255) with a maximum frequency of $80,000,000/256 = 312,500\text{Hz}$.)

Circuit

This circuit is the same as the one in engineering Blink.

Schematic diagram

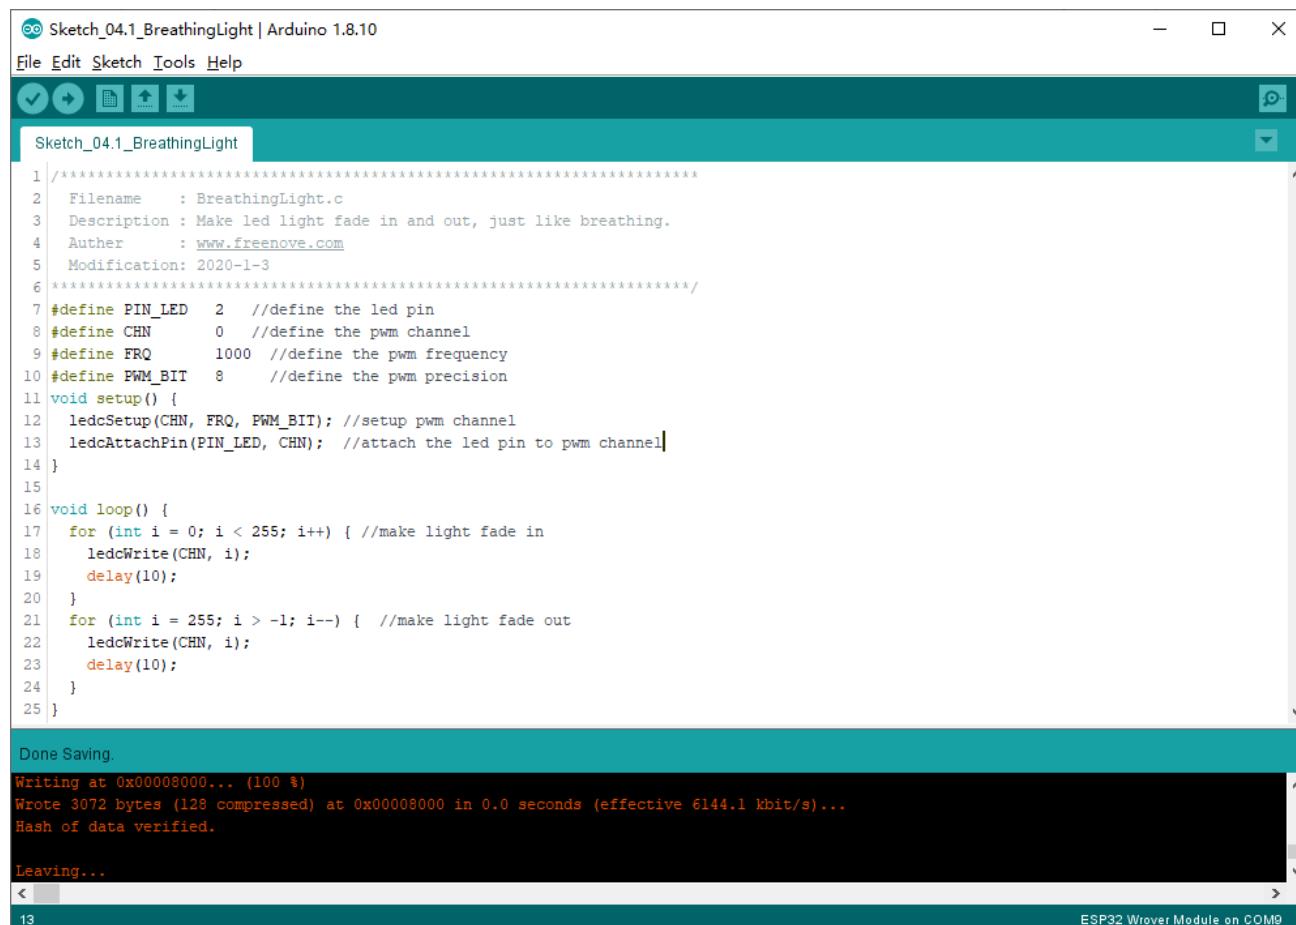

Hardware connection. **If you need any support, please contact us via: support@freenove.com**

Sketch

This project is designed to make PWM output GPIO2 with pulse width increasing from 0% to 100%, and then reducing from 100% to 0% gradually.

ESP32 Wrover Module on COM9
```

Download the code to ESP32-WROVER, and you'll see that LED is turned from on to off and then from off to on gradually like breathing.

The following is the program code:

```

1 #define PIN_LED 2      //define the led pin
2 #define CHN     0      //define the pwm channel
3 #define FRQ     1000   //define the pwm frequency
4 #define PWM_BIT 8      //define the pwm precision
5 void setup() {
6     ledcSetup(CHN, FRQ, PWM_BIT); //setup pwm channel
7     ledcAttachPin(PIN_LED, CHN); //attach the led pin to pwm channel
8 }
9
10 void loop() {
11     for (int i = 0; i < 255; i++) { //make light fade in
12         ledcWrite(CHN, i);
13         delay(10);
14     }
15     for (int i = 255; i > -1; i--) { //make light fade out
16         ledcWrite(CHN, i);
17         delay(10);
18     }
19 }
```

The PWM pin output mode of ESP32 is not the same as the traditional controller. It controls each parameter of PWM by controlling the PWM channel. Any number of GPIO can be connected with the PWM channel to output PWM. In `setup()`, you first configure a PWM channel and set the frequency and precision.

6	<code>ledcSetup(CHN, FRQ, PWM_BIT); //setup pwm channel</code>
---	--

Then the GPIO is associated with the PWM channel.

7	<code>ledcAttachPin(PIN_LED, CHN); //attach the led pin to pwm channel</code>
---	---

In the `loop()`, There are two “for” loops. The first makes the ledPin output PWM from 0% to 100% and the second makes the ledPin output PWM from 100% to 0%. This allows the LED to gradually light and extinguish.

```

11 for (int i = 0; i < 255; i++) { //make light fade in
12     ledcWrite(CHN, i);
13     delay(10);
14 }
15 for (int i = 255; i > -1; i--) { //make light fade out
16     ledcWrite(CHN, i);
17     delay(10);
18 }
```

You can also adjust the rate of the state change of LED by changing the parameters of the `delay()` function in the “for” loop.

```
double ledcSetup(uint8_t chan, double freq, uint8_t bit_num)
```

Set the frequency and accuracy of a PWM channel.

Parameters

chan: channel index. Value range :0-15

freq: frequency, it could be a decimal.

bit_num: precision of values.

```
void ledcAttachPin(uint8_t pin, uint8_t channel);  
void ledcDetachPin(uint8_t pin);
```

Bind/unbind a GPIO to a PWM channel.

```
void ledcWrite(uint8_t channel, uint32_t duty);
```

Writes the pulse width value to a PWM channel.

Project 4.2 Meteor Flowing Light

After learning about PWM, we can use it to control LED bar graph and realize a cooler flowing light. The component list, circuit, and hardware are exactly consistent with the project Flowing Light.

Sketch

Meteor flowing light will be implemented with PWM.

2 ESP32 Wrover Module on COM9

```

Download the code to ESP32-WROVER, and LED bar graph will gradually light up and out from left to right, then light up and out from right to left.

The following is the program code:

1	<code>const byte ledPins[] = {15, 2, 0, 4, 5, 18, 19, 21, 22, 23}; //define led pins</code>
2	<code>const byte chns[] = {0, 1, 2, 3, 4, 5, 6, 7, 8, 9}; //define the pwm channels</code>
3	<code>const int dutys[] = {0, 0, 0, 0, 0, 0, 0, 0, 0, 0,</code>
4	<code> 1023, 512, 256, 128, 64, 32, 16, 8, 4, 2,</code>
5	<code> 0, 0, 0, 0, 0, 0, 0, 0, 0, 0,</code>
6	<code> }; //define the pwm dutys</code>
7	<code>int ledCounts; //led counts</code>
8	<code>int delayTimes = 50; //flowing speed ,the smaller, the faster</code>
9	<code>void setup() {</code>
10	<code> ledCounts = sizeof(ledPins); //get the led counts</code>
11	<code> for (int i = 0; i < ledCounts; i++) { //setup the pwm channels</code>

```

12     ledcSetup(chns[i], 1000, 10);
13     ledcAttachPin(ledPins[i], chns[i]);
14 }
15 }
16
17 void loop() {
18     for (int i = 0; i < 20; i++) {          //flowing one side to other side
19         for (int j = 0; j < ledCounts; j++) {
20             ledcWrite(chns[j], dutys[i + j]);
21         }
22         delay(delayTimes);
23     }
24     for (int i = 0; i < 20; i++) {          //flowing one side to other side
25         for (int j = ledCounts - 1; j > -1; j--) {
26             ledcWrite(chns[j], dutys[i + (ledCounts - 1 - j)]);
27         }
28         delay(delayTimes);
29     }
30 }
```

First we defined 10 GPIO, 10 PWM channels, and 30 pulse width values.

```

const byte ledPins[] = {15, 2, 0, 4, 5, 18, 19, 21, 22, 23};      //define led pins
const byte chns[] = {0, 1, 2, 3, 4, 5, 6, 7, 8, 9};           //define the pwm channels
const int dutys[] = {0, 0, 0, 0, 0, 0, 0, 0, 0, 0,
                    1023, 512, 256, 128, 64, 32, 16, 8, 4, 2,
                    0, 0, 0, 0, 0, 0, 0, 0, 0, 0
};                                //define the pwm dutys
```

In setup(), set the frequency of 10 PWM channels to 1000Hz, the accuracy to 10bits, and the maximum pulse width to 1023. Attach GPIO to these PWM channels.

```

for (int i = 0; i < ledCounts; i++) {    //setup the pwm channels
    ledcSetup(chns[i], 1000, 10);
    ledcAttachPin(ledPins[i], chns[i]);
}
```

In loop(), a nested for loop is used to control the pulse width of the PWM, and LED bar graph moves one grid after each 1 is added in the first for loop, gradually changing according to the values in the array duties. As shown in the table below, the value of the second row is the value in the array duties, and the 10 green squares in each row below represent the 10 LEDs on the LED bar graph. Every 1 is added to I , the value of the LED bar graph will move to the right by one grid, and when it reaches the end, it will move from the end to the starting point, achieving the desired effect.

0	1	2	3	4	5	7	8	9	1	11	1	1	1	1	1	1	1	2	2	2	2	2	2	3	3	0
d	0	0	0	0	0	0	0	0	0	10	5	2	1	6	3	1	8	4	2	0	0	0	0	0	0	0

In the code, two nested for loops are used to achieve this effect.

```

for (int i = 0; i < 20; i++) {           //flowing one side to other side
    for (int j = 0; j < ledCounts; j++) {
        ledcWrite(chns[j], dutys[i + j]);
    }
    delay(delayTimes);
}

for (int i = 0; i < 20; i++) {           //flowing from one side to the other
    for (int j = ledCounts - 1; j > -1; j--) {
        ledcWrite(chns[j], dutys[i + (ledCounts - 1 - j)]);
    }
    delay(delayTimes);
}

```

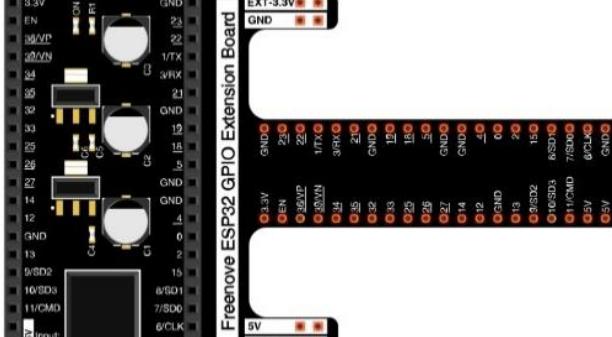

Chapter 5 RGB LED

In this chapter, we will learn how to control a RGB LED. It can emit different colors of light. Next, we will use RGB LED to make a multicolored light.

Project 5.1 Random Color Light

In this project, we will make a multicolored LED. And we can control RGB LED to switch different colors automatically.

Component List

ESP32-WROVER x1	GPIO Extension Board x1	Breadboard x1	RGBLED x1	Resistor 220Ω x3	Jumper M/M x4
					

Related knowledge

RGB LED has integrated 3 LEDs that can respectively emit red, green and blue light. And it has 4 pins. The long pin (1) is the common port, that is, 3 LED's positive or negative port. The RGB LED with common positive port and its symbol is shown below. We can make RGB LED emit various colors of light by controlling these 3 LEDs to emit light with different brightness,

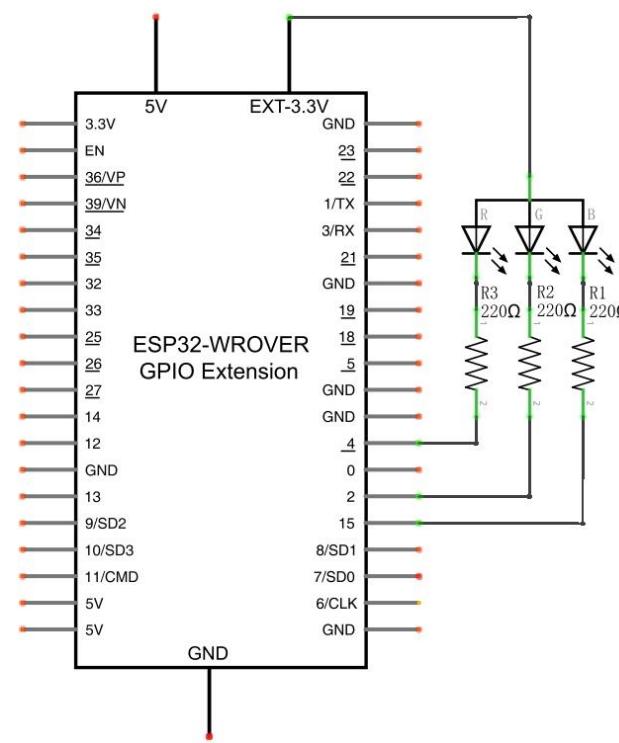

Red, green, and blue are known as three primary colors. When you combine these three primary-color lights with different brightness, it can produce almost all kinds of visible lights. Computer screens, single pixel of cell phone screen, neon, and etc. are working under this principle.

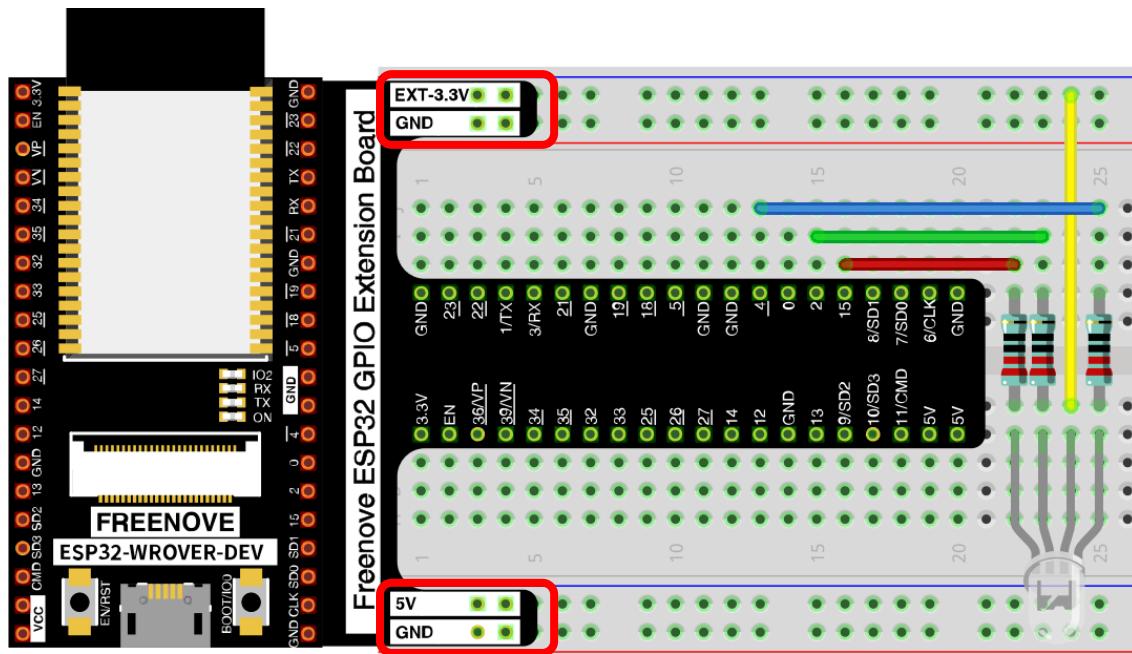

If we use three 8-bit PWMs to control the RGB LED, in theory, we can create $2^8 * 2^8 * 2^8 = 16777216$ (16 million) colors through different combinations.

13
ESP32 Wrover Module on COM9
```

With the code downloaded to ESP32-WROVER, RGB LED begins to display random colors.

If you have any concerns, please contact us via: support@freenove.com

The following is the program code:

```

1 const byte ledPins[] = {15, 2, 4};      //define red, green, blue led pins
2 const byte chns[] = {0, 1, 2};          //define the pwm channels
3 int red, green, blue;
4 void setup() {
5     for (int i = 0; i < 3; i++) {        //setup the pwm channels, 1KHz, 8bit
6         ledcSetup(chns[i], 1000, 8);
7         ledcAttachPin(ledPins[i], chns[i]);
8     }
9 }
10
11 void loop() {
12     red = random(0, 256);
13     green = random(0, 256);
14     blue = random(0, 256);
15     setColor(red, green, blue);
16     delay(200);
17 }
18
19 void setColor(byte r, byte g, byte b) {
20     ledcWrite(chns[0], 255 - r); //Common anode LED, low level to turn on the led.
21     ledcWrite(chns[1], 255 - g);
22     ledcWrite(chns[2], 255 - b);
23 }
```

Define the PWM channel and associate it with the pin connected to RGB LED, and define the variable to hold the color value and initialize it in `setup()`.

```

1 const byte ledPins[] = {15, 2, 4};      //define red, green, blue led pins
2 const byte chns[] = {0, 1, 2};          //define the pwm channels
3 int red, green, blue;
4 void setup() {
5     for (int i = 0; i < 3; i++) {        //setup the pwm channels, 1KHz, 8bit
6         ledcSetup(chns[i], 1000, 8);
7         ledcAttachPin(ledPins[i], chns[i]);
8     }
9 }
```

In `setColor()`, this function controls the output color of RGB LED by the given color value. Because the circuit uses a common anode, the LED lights up when the GPIO outputs low power. Therefore, in PWM, low level is the active level, so 255 minus the given value is necessary.

```

19 void setColor(byte r, byte g, byte b) {
20     ledcWrite(chns[0], 255 - r); //Common anode LED, low level to turn on the led.
21     ledcWrite(chns[1], 255 - g);
22     ledcWrite(chns[2], 255 - b);
23 }
```

In loop(), get three random Numbers and set them as color values.

```

12 red = random(0, 256);
13 green = random(0, 256);
14 blue = random(0, 256);
15 setColor(red, green, blue);
16 delay(200);
```

The related function of software PWM can be described as follows:

long random(min, max);

This function will return a random number(min --- max-1).

Project 5.2 Gradient Color Light

In the previous project, we have mastered the usage of RGB LED, but the random display of colors is rather stiff. This project will realize a fashionable light with soft color changes.

Component list and the circuit are exactly the same as the random color light.

Using a color model, the color changes from 0 to 255 as shown below.

In this code, the color model will be implemented and RGB LED will change colors along the model.

Sketch_05.2_SoftColorfullLight

The following is the program code:

```

1 const byte ledPins[] = {15, 2, 4};      //define led pins
2 const byte chns[] = {0, 1, 2};          //define the pwm channels
3
4 void setup() {
5     for (int i = 0; i < 3; i++) {        //setup the pwm channels
6         ledcSetup(chns[i], 1000, 8);
7         ledcAttachPin(ledPins[i], chns[i]);
8     }
9 }
10
11 void loop() {
12     for (int i = 0; i < 256; i++) {
13         setColor(wheel(i));
14         delay(20);
15     }
```

```
16 }  
17  
18 void setColor(long rgb) {  
19     ledcWrite(chns[0], 255 - (rgb >> 16) & 0xFF);  
20     ledcWrite(chns[1], 255 - (rgb >> 8) & 0xFF);  
21     ledcWrite(chns[2], 255 - (rgb >> 0) & 0xFF);  
22 }  
23  
24 long wheel(int pos) {  
25     long WheelPos = pos % 0xff;  
26     if (WheelPos < 85) {  
27         return ((255 - WheelPos * 3) << 16) | ((WheelPos * 3) << 8);  
28     } else if (WheelPos < 170) {  
29         WheelPos -= 85;  
30         return (((255 - WheelPos * 3) << 8) | (WheelPos * 3));  
31     } else {  
32         WheelPos -= 170;  
33         return ((WheelPos * 3) << 16 | (255 - WheelPos * 3));  
34     }  
35 }
```

In `setColor()`, a variable represents the value of RGB, and a hexadecimal representation of color is a common representation, such as `0xAABBCC`, where AA represents the red value, BB represents the green value, and CC represents the blue value. The use of a variable can make the transmission of parameters more convenient, in the split, only a simple operation can take out the value of each color channel

```
18 void setColor(long rgb) {  
19     ledcWrite(chns[0], 255 - (rgb >> 16) & 0xFF);  
20     ledcWrite(chns[1], 255 - (rgb >> 8) & 0xFF);  
21     ledcWrite(chns[2], 255 - (rgb >> 0) & 0xFF);  
22 }
```

The `wheel()` function is the color selection method for the color model introduced earlier. The **pos** parameter ranges from 0 to 255 and outputs a color value in hexadecimal.

Chapter 6 Buzzer

In this chapter, we will learn about buzzers that can make sounds.

Project 6.1 Doorbell

We will make this kind of doorbell: when the button is pressed, the buzzer sounds; and when the button is released, the buzzer stops sounding.

Component List

ESP32-WROVER x1	GPIO Extension Board x1
Breadboard x1	
Jumper M/M x6	
NPN transistor x1 (S8050)	Active buzzer x1
Push button x1	Resistor 1kΩ x1
Resistor 10kΩ x2	

Component knowledge

Buzzer

Buzzer is a sounding component, which is widely used in electronic devices such as calculator, electronic warning clock and alarm. Buzzer has two types: active and passive. Active buzzer has oscillator inside, which will sound as long as it is supplied with power. Passive buzzer requires external oscillator signal (generally use PWM with different frequency) to make a sound.

Active buzzer is easy to use. Generally, it can only make a specific frequency of sound. Passive buzzer requires an external circuit to make a sound, but it can be controlled to make a sound with different frequency. The resonant frequency of the passive buzzer is 2kHz, which means the passive buzzer is loudest when its resonant frequency is 2kHz.

Next, we will use an active buzzer to make a doorbell and a passive buzzer to make an alarm.

How to identify active and passive buzzer?

1. Usually, there is a label on the surface of active buzzer covering the vocal hole, but this is not an absolute judgment method.
2. Active buzzers are more complex than passive buzzers in their manufacture. There are many circuits and crystal oscillator elements inside active buzzers; all of this is usually protected with a waterproof coating (and a housing) exposing only its pins from the underside. On the other hand, passive buzzers do not have protective coatings on their underside. From the pin holes viewing of a passive buzzer, you can see the circuit board, coils, and a permanent magnet (all or any combination of these components depending on the model).

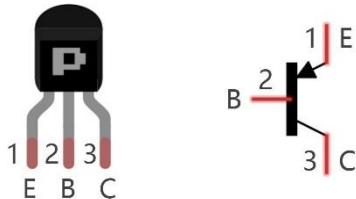

Transistor

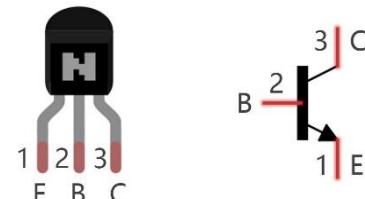

Because the buzzer requires such large current that GPIO of ESP32 output capability cannot meet the requirement, a transistor of NPN type is needed here to amplify the current.

Transistor, the full name: semiconductor transistor, is a semiconductor device that controls current. Transistor can be used to amplify weak signal, or works as a switch. It has three electrodes(PINs): base (b), collector (c) and emitter (e). When there is current passing between "be", "ce" will allow several-fold current (transistor magnification) pass, at this point, transistor works in the amplifying area. When current between "be" exceeds a certain value, "ce" will not allow current to increase any longer, at this point, transistor works in the saturation area. Transistor has two types as shown below: PNP and NPN,

PNP transistor

NPN transistor

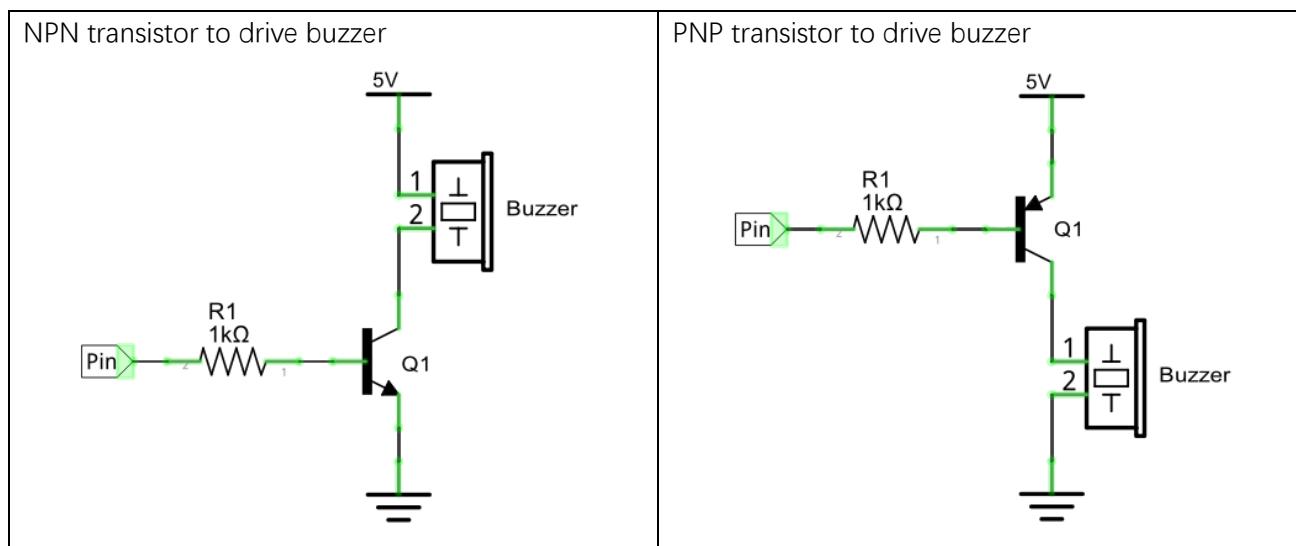

In our kit, the PNP transistor is marked with 8550, and the NPN transistor is marked with 8050.

Based on the transistor's characteristics, it is often used as a switch in digital circuits. As micro-controller's capacity to output current is very weak, we will use transistor to amplify current and drive large-current components.

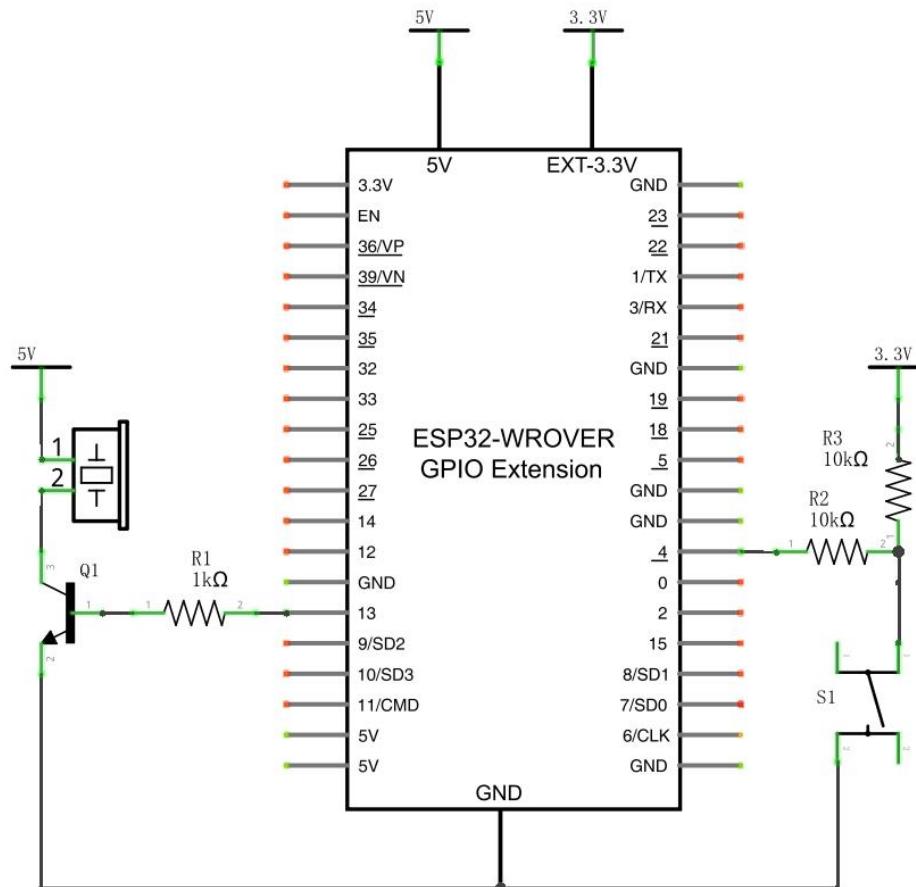

When use NPN transistor to drive buzzer, we often adopt the following method. If GPIO outputs high level, current will flow through R1, the transistor will get conducted, and the buzzer will sound. If GPIO outputs low level, no current flows through R1, the transistor will not be conducted, and buzzer will not sound.

When use PNP transistor to drive buzzer, we often adopt the following method. If GPIO outputs low level, current will flow through R1, the transistor will get conducted, and the buzzer will sound. If GPIO outputs high level, no current flows through R1, the transistor will not be conducted, and buzzer will not sound.

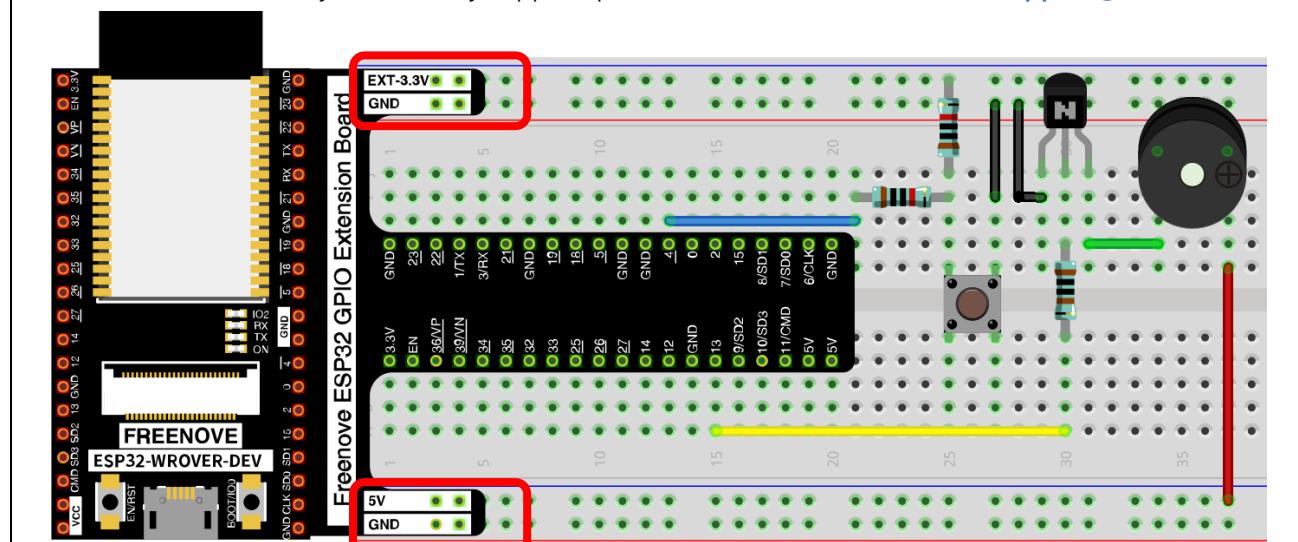

Circuit

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: support@freenove.com

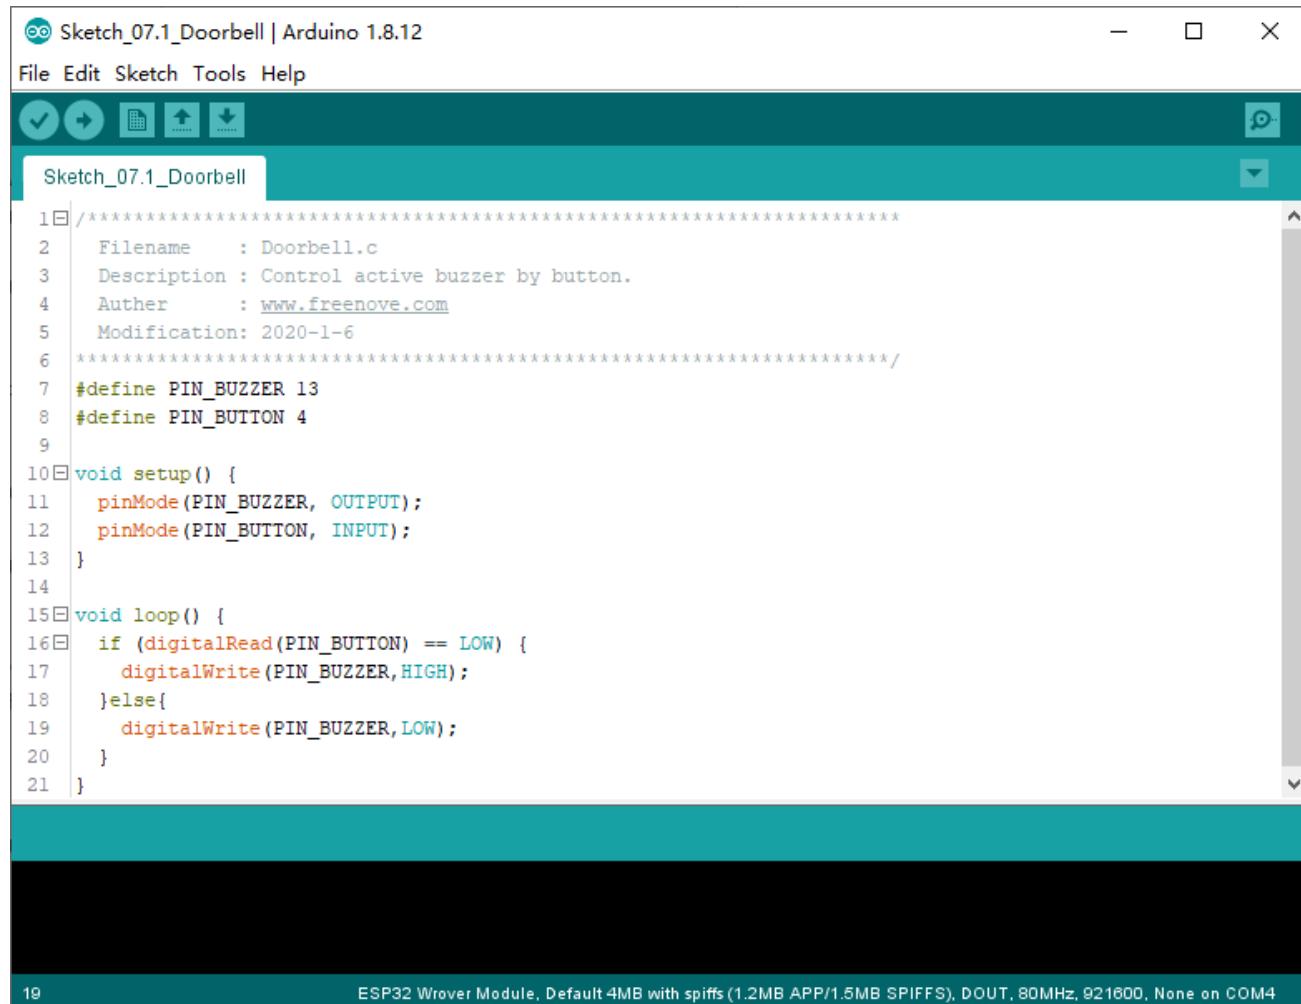

Note: in this circuit, the power supply for buzzer is 5V, and pull-up resistor of the button connected to the power 3.3V. The buzzer can work when connected to power 3.3V, but it will reduce the loudness.

Any concerns? ✉ support@freenove.com

Sketch

In this project, a buzzer will be controlled by a push button switch. When the button switch is pressed, the buzzer sounds and when the button is released, the buzzer stops. It is analogous to our earlier project that controlled a LED ON and OFF.

Sketch_06.1_Doorbell

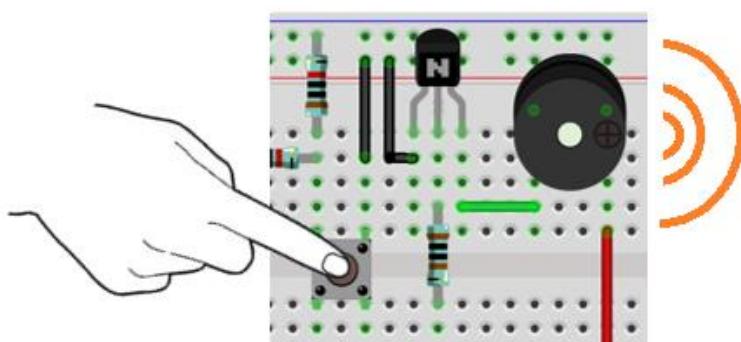

The screenshot shows the Arduino IDE interface with the following details:

- Title Bar:** Sketch_07.1_Doorbell | Arduino 1.8.12
- Menu Bar:** File Edit Sketch Tools Help
- Toolbar:** Includes icons for Open, Save, Print, and Upload.
- Code Editor:** Displays the C++ code for the sketch. The code defines pins for a buzzer and a button, sets up the button as an input and the buzzer as an output, and then loops to read the button state and set the buzzer state accordingly.

```
1 // ****
2 Filename      : Doorbell.c
3 Description   : Control active buzzer by button.
4 Author        : www.freenove.com
5 Modification : 2020-1-6
6 ****
7 #define PIN_BUZZER 13
8 #define PIN_BUTTON 4
9
10 void setup() {
11     pinMode(PIN_BUZZER, OUTPUT);
12     pinMode(PIN_BUTTON, INPUT);
13 }
14
15 void loop() {
16     if (digitalRead(PIN_BUTTON) == LOW) {
17         digitalWrite(PIN_BUZZER, HIGH);
18     }else{
19         digitalWrite(PIN_BUZZER, LOW);
20     }
21 }
```

- Status Bar:** Shows "19" (line number), "ESP32 Wrover Module, Default 4MB with spiffs (1.2MB APP/1.5MB SPIFFS), DOUT, 80MHz, 921600, None on COM4".

Download the code to ESP32-WROVER, press the push button switch and the buzzer will sound. Release the push button switch and the buzzer will stop.

Any concerns? [✉ support@freenove.com](mailto:support@freenove.com)

The following is the program code:

```
1 #define PIN_BUZZER 13
2 #define PIN_BUTTON 4
3
4 void setup() {
5     pinMode(PIN_BUZZER, OUTPUT);
6     pinMode(PIN_BUTTON, INPUT);
7 }
8
9 void loop() {
10    if (digitalRead(PIN_BUTTON) == LOW) {
11        digitalWrite(PIN_BUZZER, HIGH);
12    }else{
13        digitalWrite(PIN_BUZZER, LOW);
14    }
15 }
```

The code is logically the same as using button to control LED.

Project 6.2 Alertor

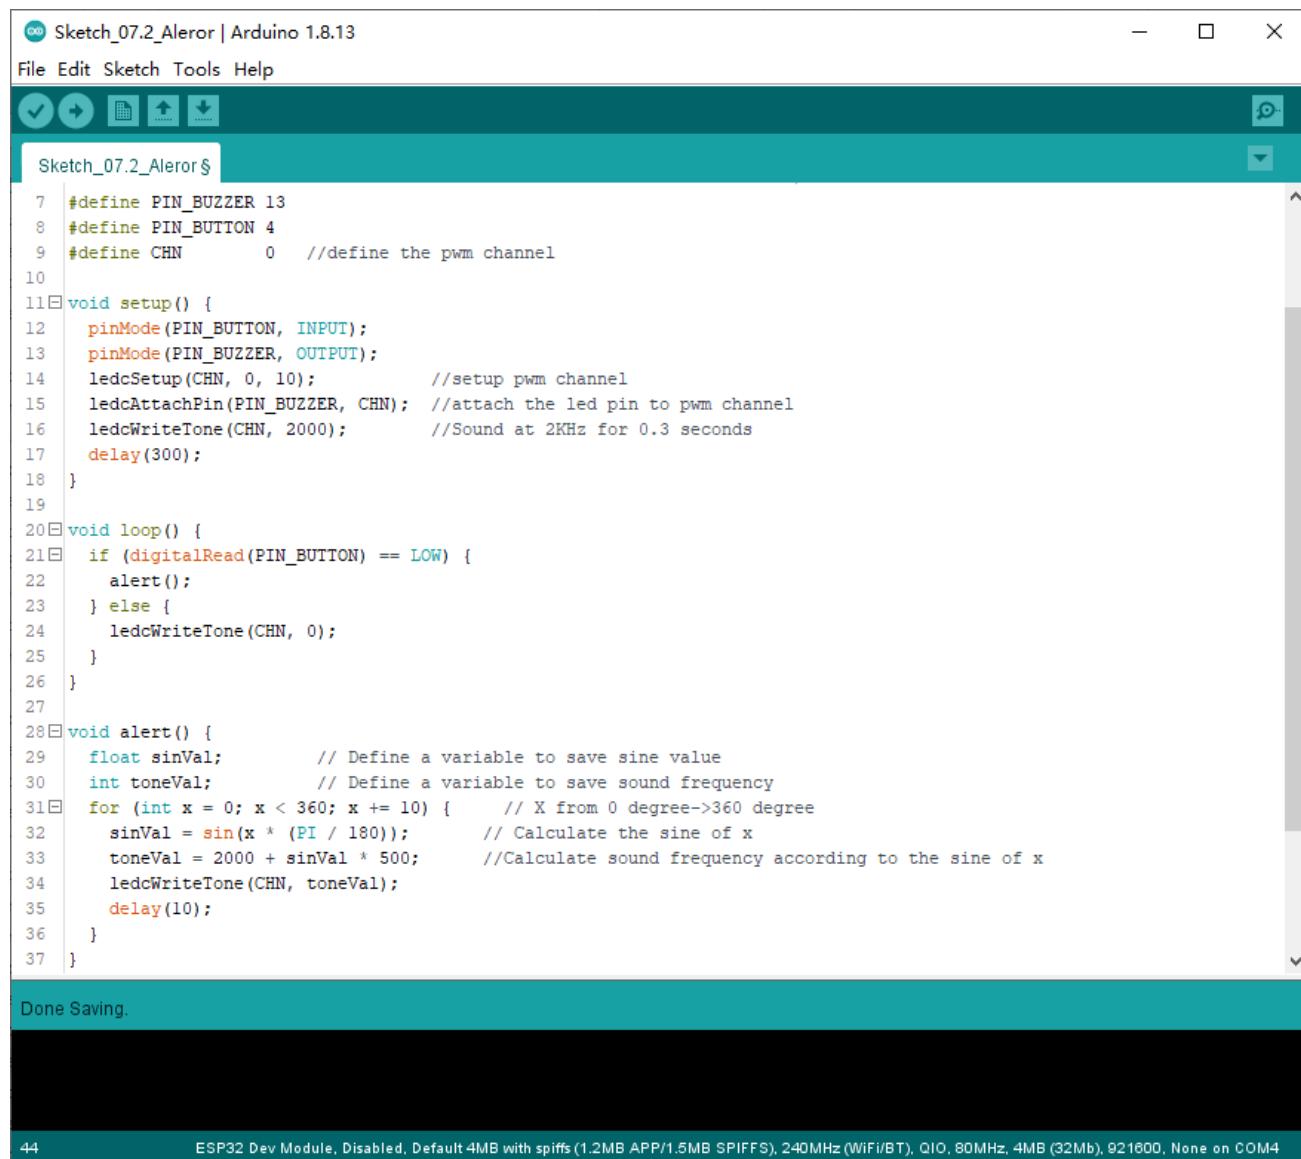

Next, we will use a passive buzzer to make an alarm.

Component list and the circuit is similar to the last section. In the Doorbell circuit only the **active buzzer** needs to be **replaced** with a **passive buzzer**.

Sketch

In this project, the buzzer alarm is controlled by the button. Press the button, then buzzer sounds. If you release the button, the buzzer will stop sounding. It is logically the same as using button to control LED, but in the control method, passive buzzer requires PWM of certain frequency to sound.

Sketch_06.2_Alertor

The screenshot shows the Arduino IDE interface with the following details:

- Title Bar:** Sketch_07.2_Aleror | Arduino 1.8.13
- Menu Bar:** File Edit Sketch Tools Help
- Toolbar:** Includes icons for Save, Run, Upload, and others.
- Code Editor:** Displays the C++ code for the sketch. The code defines pins for the button and buzzer, sets up PWM channels, and implements a sine wave alert function.
- Status Bar:** Shows "Done Saving."
- Bottom Status:** Provides system information: ESP32 Dev Module, Disabled, Default 4MB with spiffs (1.2MB APP/1.5MB SPIFFS), 240MHz (WiFi/BT), QIO, 80MHz, 4MB (32Mb), 921600, None on COM4.

```

7 #define PIN_BUZZER 13
8 #define PIN_BUTTON 4
9 #define CHN          0 //define the pwm channel
10
11 void setup() {
12   pinMode(PIN_BUTTON, INPUT);
13   pinMode(PIN_BUZZER, OUTPUT);
14   ledcSetup(CHN, 0, 10);           //setup pwm channel
15   ledcAttachPin(PIN_BUZZER, CHN); //attach the led pin to pwm channel
16   ledcWriteTone(CHN, 2000);       //Sound at 2KHz for 0.3 seconds
17   delay(300);
18 }
19
20 void loop() {
21   if (digitalRead(PIN_BUTTON) == LOW) {
22     alert();
23   } else {
24     ledcWriteTone(CHN, 0);
25   }
26 }
27
28 void alert() {
29   float sinVal;                  // Define a variable to save sine value
30   int toneVal;                   // Define a variable to save sound frequency
31   for (int x = 0; x < 360; x += 10) { // X from 0 degree->360 degree
32     sinVal = sin(x * (PI / 180)); // Calculate the sine of x
33     toneVal = 2000 + sinVal * 500; //Calculate sound frequency according to the sine of x
34     ledcWriteTone(CHN, toneVal);
35     delay(10);
36   }
37 }

```

Download the code to ESP32-WROVER, press the button, then alarm sounds. And when the button is released, the alarm will stop sounding.

The following is the program code:

```
1 #define PIN_BUZZER 13
2 #define PIN_BUTTON 4
3 #define CHN      0 //define the pwm channel
4
5 void setup() {
6     pinMode(PIN_BUTTON, INPUT);
7     pinMode(PIN_BUZZER, OUTPUT);
8     ledcSetup(CHN, 0, 10);           //setup pwm channel
9     ledcAttachPin(PIN_BUZZER, CHN); //attach the led pin to pwm channel
10    ledcWriteTone(CHN, 2000);       //Sound at 2KHz for 0.3 seconds
11    delay(300);
12 }
13
14 void loop() {
15     if (digitalRead(PIN_BUTTON) == LOW) {
16         alert();
17     } else {
18         ledcWriteTone(CHN, 0);
19     }
20 }
21
22 void alert() {
23     float sinVal;          // Define a variable to save sine value
24     int toneVal;           // Define a variable to save sound frequency
25     for (int x = 0; x < 360; x += 10) { // X from 0 degree->360 degree
26         sinVal = sin(x * (PI / 180)); // Calculate the sine of x
27         toneVal = 2000 + sinVal * 500; //Calculate sound frequency according to the sine of x
28         ledcWriteTone(CHN, toneVal);
29         delay(10);
30     }
31 }
```

The code is the same as the active buzzer logically, but the way to control the buzzer is different. Passive buzzer requires PWM of certain frequency to control, so you need to create a PWM channel through ledcSetup(). Here ledcWriteTone() is designed to generating square wave with variable frequency and duty cycle fixed to 50%, which is a better choice for controlling the buzzer.

```
8  ledcSetup(CHN, 0, 10);           //setup pwm channel
9  ledcAttachPin(PIN_BUZZER, CHN); //attach the led pin to pwm channel
10 ledcWriteTone(CHN, 2000);       //Sound at 2KHz for 0.3 seconds
```

In the while cycle of main function, when the button is pressed, subfunction alert() will be called and the alertor will issue a warning sound. The frequency curve of the alarm is based on the sine curve. We need to calculate the sine value from 0 to 360 degree and multiply a certain value (here is 500) and plus the resonant frequency of buzzer.

```
22 void alert() {
23     float sinVal;           // Define a variable to save sine value
24     int toneVal;            // Define a variable to save sound frequency
25     for (int x = 0; x < 360; x += 10) {      // X from 0 degree->360 degree
26         sinVal = sin(x * (PI / 180));        // Calculate the sine of x
27         toneVal = 2000 + sinVal * 500;        //Calculate sound frequency according to the sine of x
28         ledcWriteTone(CHN, toneVal);
29         delay(10);
30     }
31 }
```

If you want to close the buzzer, just set PWM frequency of the buzzer pin to 0.

```
18 ledcWriteTone(CHN, 0);
```

Reference

```
double ledcWriteTone(uint8_t channel, double freq);
```

This updates the tone frequency value on the given channel.

This function has some bugs in the current version (V1.0.4): when the call interval is less than 20ms, the resulting PWM will have an exception. We will get in touch with the authorities to solve this problem and give solutions in the following two projects.

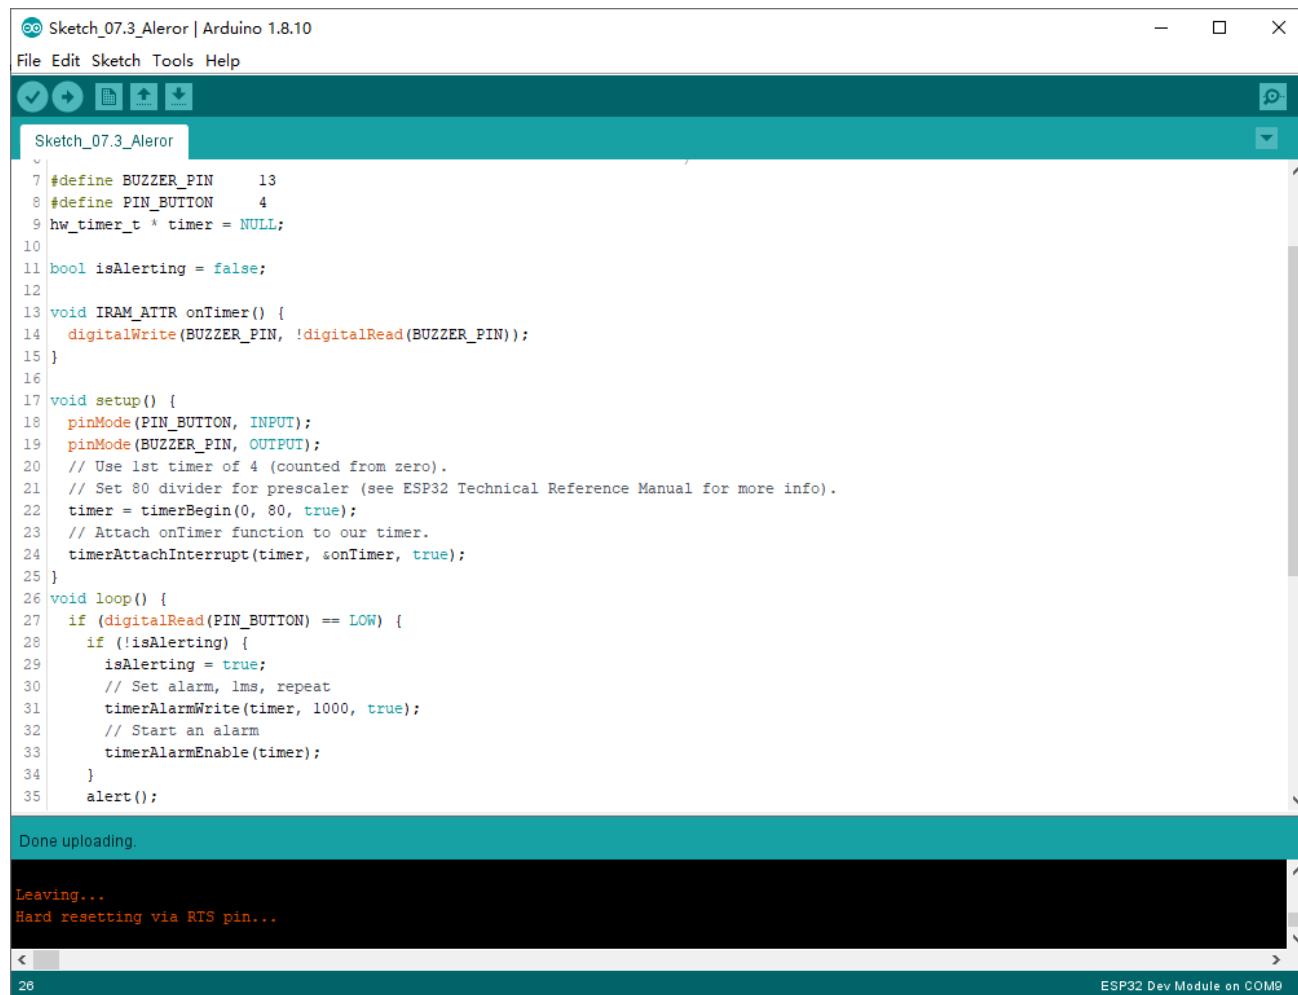

Project 6.3 Alertor (use timer)

Due to some bugs in the function ledcWriteTone(), this project uses timer to generate software PWM to control the buzzer. The circuit is exactly the same as the last project.

Sketch

The core of the code of this project is to create a timer to change the GPIO state to generate 50% pulse width PWM, and change the PWM frequency by changing the timing time of the timer.

Sketch_06.3_Alertor

The screenshot shows the Arduino IDE interface with the following details:

- Title Bar:** Sketch_07.3_Aleror | Arduino 1.8.10
- Menu Bar:** File Edit Sketch Tools Help
- Toolbar:** Standard toolbar icons for Open, Save, Upload, etc.
- Code Editor:** The main area contains the C++ code for the Sketch_06.3_Alertor project. The code defines pins for a buzzer and a button, initializes a timer, and sets up an interrupt for the button. It then enters a loop where it checks if the button is pressed. If pressed, it starts a timer and sets the alerting state to true. The code uses the timer's alarm feature to generate a 50% duty cycle PWM signal for the buzzer.
- Status Bar:** Shows "Done uploading." at the top and "Leaving... Hard resetting via RTS pin..." followed by "ESP32 Dev Module on COM9" at the bottom.

Download the code to ESP32-WROVER, press the button, then the alarm sounds. And when the button is released, the alarm will stop sounding.

The following is the program code:

```
1 #define BUZZER_PIN      13
2 #define PIN_BUTTON      4
3 hw_timer_t * timer = NULL;
4
5 bool isAlerting = false;
6
7 void IRAM_ATTR onTimer() {
8     digitalWrite(BUZZER_PIN, ! digitalRead(BUZZER_PIN));
9 }
10
11 void setup() {
12     pinMode(PIN_BUTTON, INPUT);
13     pinMode(BUZZER_PIN, OUTPUT);
14     // Use 1st timer of 4 (counted from zero).
15     // Set 80 divider for prescaler (see ESP32 Technical Reference Manual for more info).
16     timer = timerBegin(0, 80, true);
17     // Attach onTimer function to our timer.
18     timerAttachInterrupt(timer, &onTimer, true);
19 }
20
21 void loop() {
22     if (digitalRead(PIN_BUTTON) == LOW) {
23         if (! isAlerting) {
24             isAlerting = true;
25             // Set alarm, 1ms, repeat
26             timerAlarmWrite(timer, 1000, true);
27             // Start an alarm
28             timerAlarmEnable(timer);
29         }
30         alert();
31     } else {
32         if (isAlerting) {
33             isAlerting = false;
34             timerAlarmDisable(timer);
35             digitalWrite(BUZZER_PIN, LOW);
36         }
37     }
38 }
39
40 void alert() {
41     float sinVal;
42     int toneVal;
43     for (int x = 0; x < 360; x += 1) {
44         sinVal = sin(x * (PI / 180));
```

```
44     toneVal = 2000 + sinVal * 500;  
45     timerAlarmWrite(timer, 500000 / toneVal, true);  
46     delay(1);  
47 }  
48 }
```

In the code, first define a timer variable, timer, and then create the timer in setup(), setting the function onTimer() that the timer will execute.

```
3  hw_timer_t * timer = NULL;  
4  
5  // Set 80 divider for prescaler (see ESP32 Technical Reference Manual for more info).  
6  timer = timerBegin(0, 80, true);  
7  // Attach onTimer function to our timer.  
8  timerAttachInterrupt(timer, &onTimer, true);
```

In the loop(), use the timerAlarmWrite() to set the timer time and use timerAlarmEnable() to start the timer. Using the flag bit isAlerting, the code to set and start the timer is executed only when the key is pressed.

```
22 if (!isAlerting) {  
23     isAlerting = true;  
24     // Set alarm, 1ms, repeat  
25     timerAlarmWrite(timer, 1000, true);  
26     // Start an alarm  
27     timerAlarmEnable(timer);  
28 }
```

After the key is released, stop the timer and make the buzzer's GPIO output low.

```
31 if (isAlerting) {  
32     isAlerting = false;  
33     timerAlarmDisable(timer);  
34     digitalWrite(BUZZER_PIN, LOW);  
35 }
```

Reference

```
typedef struct hw_timer_s hw_timer_t;
```

Timer type, used to define a timer variable.

```
hw_timer_t * timerBegin(uint8_t timer, uint16_t divider, bool countUp);
```

Initialize the timer.

parameters

timer: The timer to initialize

divider: The frequency divider coefficient of the timer, the value range is 2-65535. The default clock frequency is 80MHz.

countUp: true means counter up technique and false means counter down.

```
void timerAttachInterrupt(hw_timer_t *timer, void (*fn)(void), bool edge);
```

Bind the function to execute when the interrupt is generated for the timer.

```
void timerAlarmWrite(hw_timer_t *timer, uint64_t interruptAt, bool autoreload);
```

Set the timer time.

```
void timerAlarmEnable(hw_timer_t *timer);
```

```
void timerAlarmDisable(hw_timer_t *timer);
```

Start/stop the timer.

Project 6.4 Alertor (use idf)

Although using software "timer" to generate PWM is to achieve our purpose, but frequent interruption will reduce the execution efficiency of the main program code, and when the project is too large, this problem will be more serious. Obviously, software PWM is not the optimal choice.

This project uses the function in esp-idf-sdk code base to make the hardware PWM with adjustable frequency, and then control the buzzer.

Because the code of this project applies the functions in the esp-idf-sdk code base, which is beyond the scope of "Arduino", and there are many unfamiliar functions, it will be more complex.

The circuit is exactly the same as the previous project.

Sketch

Sketch_06.4_Alertor

The screenshot shows the Arduino IDE interface with the sketch titled "Sketch_06.4_Alertor". The code is as follows:

```
Sketch_07.4_Alertor | Arduino 1.8.10

19     ledc_channel_config_t ledc_channel = {
20         LEDC_HS_CH0_GPIO,
21         LEDC_HIGH_SPEED_MODE,
22         LEDC_CHANNEL_0,
23         LEDC_INTR_DISABLE,
24         LEDC_HS_TIMER,
25         0,
26         0
27     };
28     ledc_timer_config_t ledc_timer = {
29         LEDC_HIGH_SPEED_MODE,
30         LEDC_TIMER_10_BIT,
31         LEDC_HS_TIMER,
32         5000
33     };
34     // Set configuration of timer0 for high speed channels
35     ledc_timer_config(&ledc_timer);
36     // Set LED Controller with previously prepared configuration
37     ledc_channel_config(&ledc_channel);
38     ledc_fade_func_install(0);
39 }
40 void loop() {
41     if (digitalRead(PIN_BUTTON) == LOW) {
42         if (!isAlerting) {
43             isAlerting = true;
```

```
44         ledc_set_duty_and_update(LEDC_HS_MODE, LEDC_CHANNEL_0, 0, 0);
45     }
46     alert();
47 }
48 else {
49     if (isAlerting) {
50         isAlerting = false;
51         ledc_set_duty_and_update(LEDC_HS_MODE, LEDC_CHANNEL_0, 0, 0);
52     }
53 }
54 }
55
56 void alert() {
57     float sinVal;
58     int toneVal;
59     for (int x = 0; x < 360; x += 1) {
60         sinVal = sin(x * (PI / 180));
61         toneVal = 2000 + sinVal * 500;
62         ledc_set_freq(LEDC_HS_MODE, LEDC_TIMER_0, toneVal);
63         ledc_set_duty_and_update(LEDC_HS_MODE, LEDC_CHANNEL_0, 512, 0);
64         delay(1);
65     }
66 }
```

The project code uses a lot of new functions, which are standard functions from the idf-sdk library. The code logic of the project is the same, but the method of generating PWM is different.

Functionality Overview

Getting LED to work on a specific channel in either high or low speed mode requires three steps:

1. Configure Timer by specifying the PWM signal's frequency and duty cycle resolution.
2. Configure Channel by associating it with the timer and GPIO to output the PWM signal.
3. Change PWM Signal that drives the output in order to change LED's intensity. This can be done under the full control of software or with hardware's fading functions.

Chapter 7 Serial Communication

Serial Communication is a means of communication between different devices/devices. This section describes ESP32's Serial Communication.

Project 7.1 Serial Print

This project uses ESP32's serial communicator to send data to the computer and print it on the serial monitor.

Component List

ESP32-WROVER x1	GPIO Extension Board x1

Micro USB Wire x1

Related knowledge

Serial communication

Serial communication generally refers to the Universal Asynchronous Receiver/Transmitter (UART), which is commonly used in electronic circuit communication. It has two communication lines, one is responsible for sending data (TX line) and the other for receiving data (RX line). The serial communication connections of two devices is as follows:

Before serial communication starts, the baud rate of both sides must be the same. Communication between devices can work only if the same baud rate is used. The baud rates commonly used is 9600 and 115200.

Serial port on ESP32

Freenove ESP32 has integrated USB to serial transfer, so it could communicate with computer connecting to USB cable.

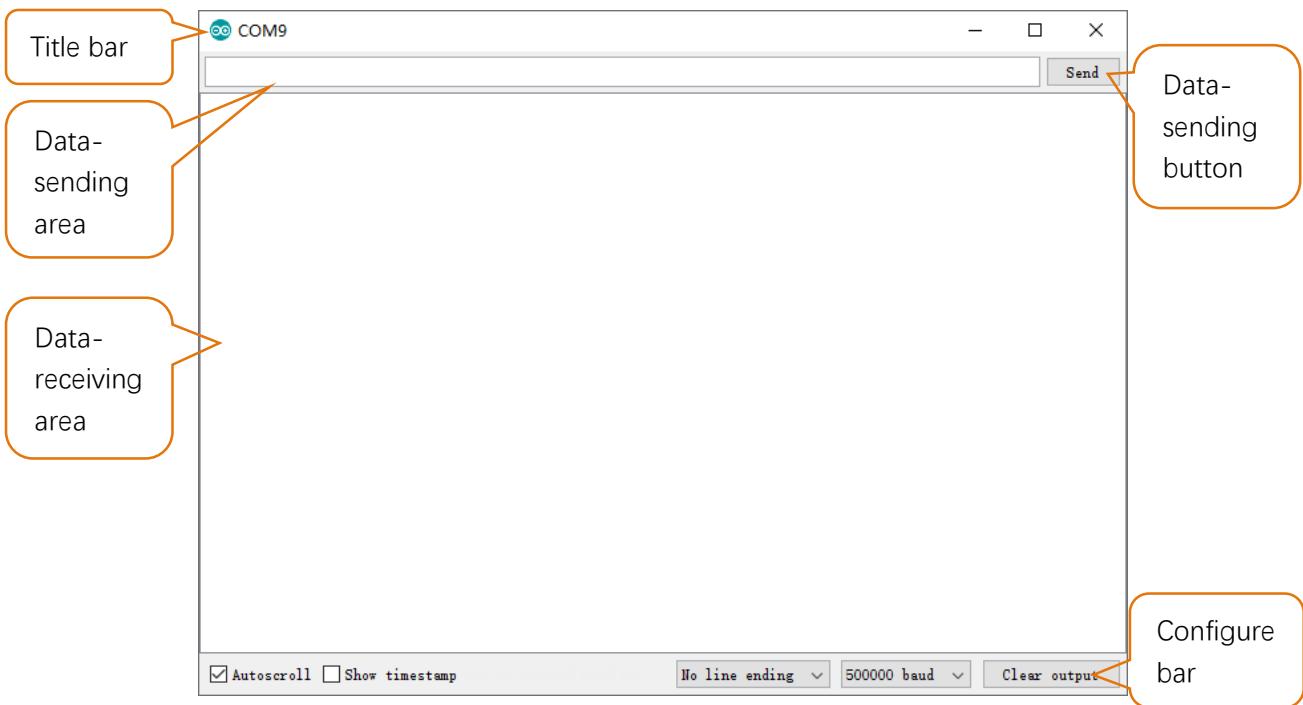

Arduino Software also uploads code to Freenove ESP32 through the serial connection.

Your computer identifies serial devices connecting to it as COMx. We can use the Serial Monitor window of Arduino Software to communicate with Freenove ESP32, connect Freenove ESP32 to computer through the USB cable, choose the correct device, and then click the Serial Monitor icon to open the Serial Monitor window.

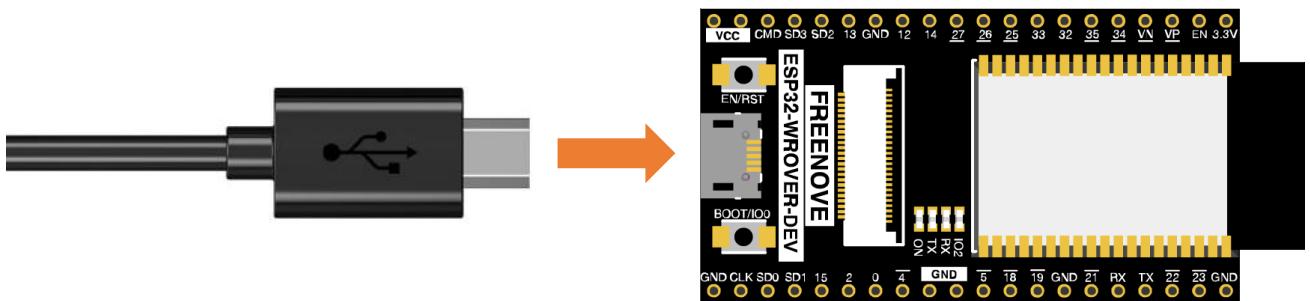

Interface of serial monitor window is as follows. If you can't open it, make sure Freenove ESP32 has been connected to the computer, and choose the right serial port in the menu bar "Tools".

Circuit

Connect Freenove ESP32 to the computer with USB cable

Sketch

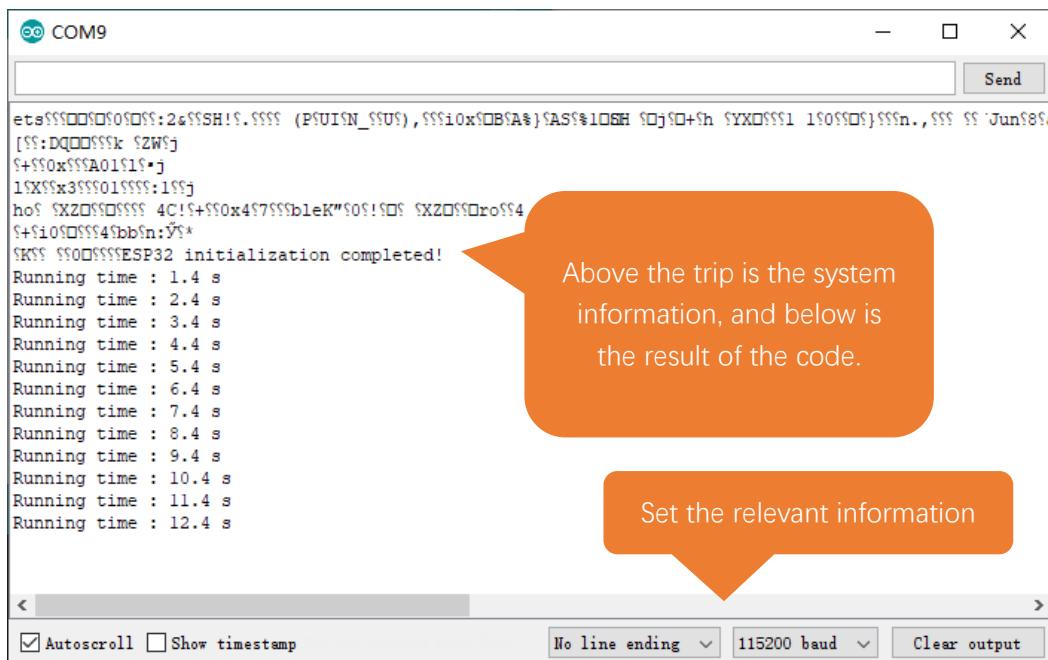

Sketch_07.1_SerialPrinter

The screenshot shows the Arduino IDE interface with the following details:

- Title Bar:** Sketch_08.1_SerialPrinter | Arduino 1.8.10
- Menu Bar:** File Edit Sketch Tools Help
- Toolbar:** Includes icons for Save, Open, Upload, and Download.
- Sketch Area:** Displays the code for "SerialPrinter.c". The code includes comments at the top and two functions: setup() and loop().

```
1 //*****\n2 Filename : SerialPrinter.c\n3 Description : Use UART send some data to PC, and show them on serial monitor.\n4 Author : www.freenove.com\n5 Modification: 2020-1-7\n6 *****/\n7\n8 void setup() {\n9     Serial.begin(115200);\n10    Serial.println("ESP32 initialization completed!");\n11 }\n12\n13 void loop() {\n14     Serial.printf("Running time : %.1f s\n", millis() / 1000.0f);\n15     delay(1000);\n16 }\n17
```
- Status Bar:** Shows "Done Saving.", "Hash of data verified.", "Leaving...", and "Hard resetting via RTS pin...".

Download the code to ESP32-WROVER, open the serial port monitor, set the baud rate to 115200, and press the reset button. As shown in the following figure:

Any concerns? ✉ support@freenove.com

As shown in the image above, "ESP32 initialization completed! " The previous is the printing message when the system is started, it uses the baud rate of 120,000, which is incorrect, so the garbled code is displayed. The user program is then printed at a baud rate of 115200.

How do I disable messages printed at system startup?

Use a jumper wire and connect one of its ends to GPIO5 of development board and the other to GND, so that we can disable the system to print out startup messages.

For more information, click [here](#).

The following is the program code:

```

1 void setup() {
2     Serial.begin(115200);
3     Serial.println("ESP32 initialization completed! ");
4 }
5
6 void loop() {
7     Serial.printf("Running time : %.1f s\n", millis() / 1000.0f);
8     delay(1000);
9 }
```

Reference

<code>void begin(unsigned long baud, uint32_t config=SERIAL_8N1, int8_t rxPin=-1, int8_t txPin=-1, bool invert=false, unsigned long timeout_ms = 20000UL);</code>

Initializes the serial port. Parameter baud is baud rate, other parameters generally use the default value.

<code>size_t println(arg);</code>

Print to the serial port and wrap. The parameter **arg** can be a number, a character, a string, an array of characters, etc.

<code>size_t printf(const char * format, ...) __attribute__ ((format (printf, 2, 3)));</code>

Print formatted content to the serial port in the same way as print in standard C.

<code>unsigned long millis();</code>

Returns the number of milliseconds since the current system was booted.

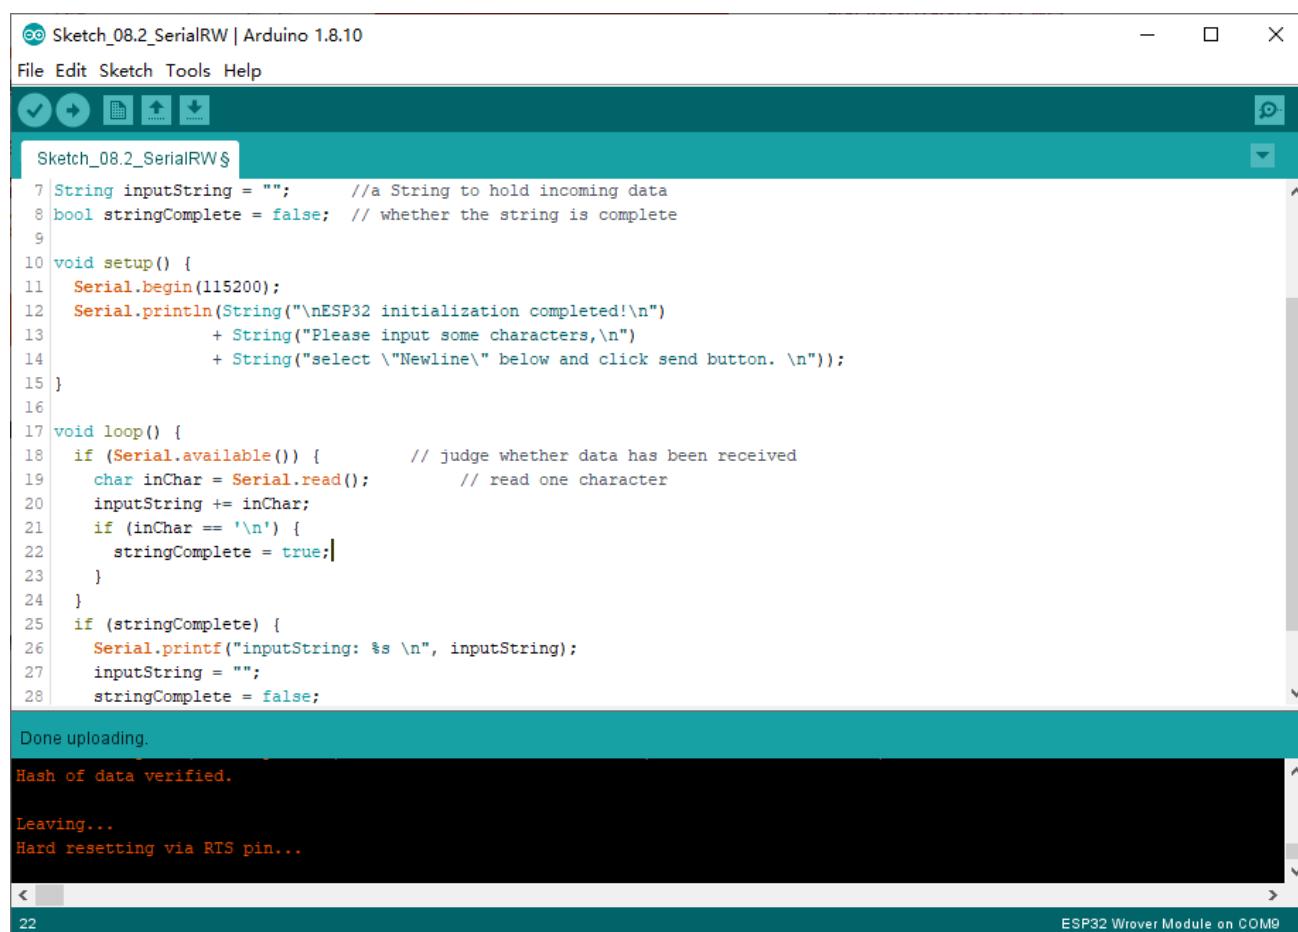

Project 7.2 Serial Read and Write

From last section, we use serial port on Freenove ESP32 to send data to a computer, now we will use that to receive data from computer.

Component and circuit are the same as in the previous project.

Sketch

Sketch_07.2_SerialRW

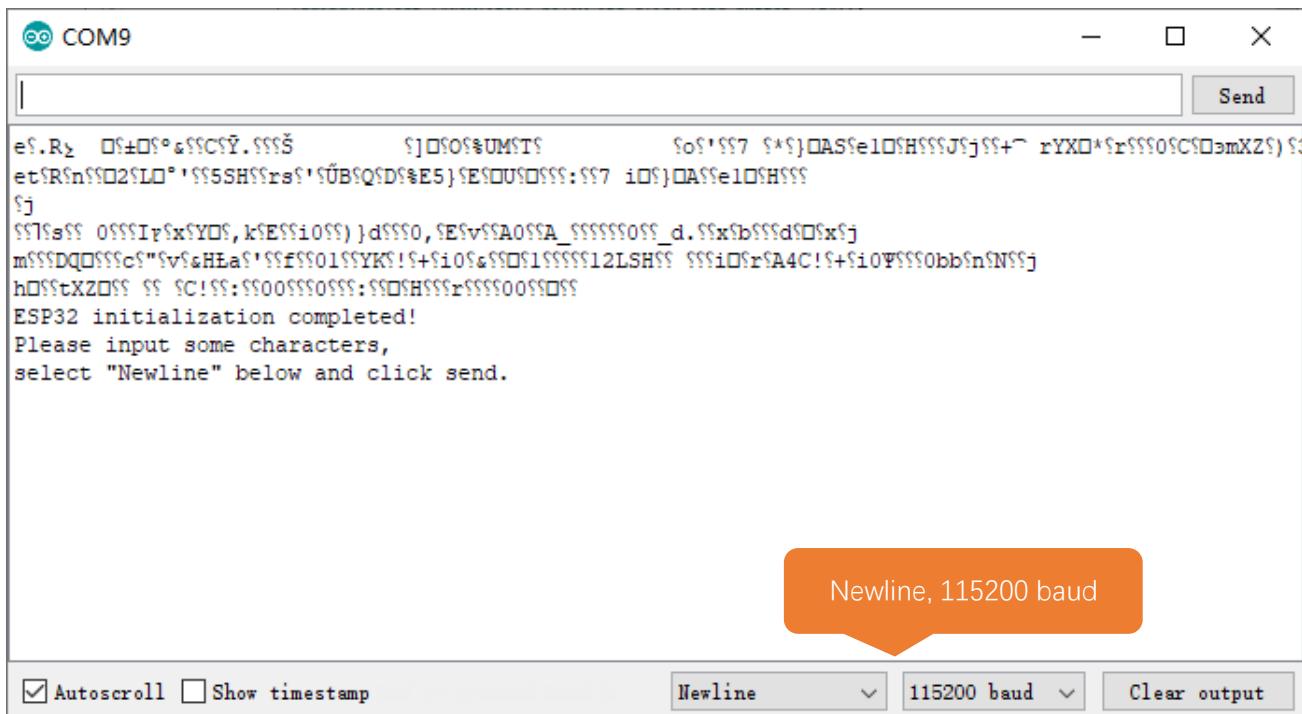

The screenshot shows the Arduino IDE interface with the following details:

- Title Bar:** Sketch_08.2_SerialRW | Arduino 1.8.10
- Menu Bar:** File Edit Sketch Tools Help
- Toolbar:** Includes icons for Save, Run, Stop, Upload, and Download.
- Code Editor:** Displays the C++ code for the sketch. The code initializes the serial port at 115200 baud, prints a welcome message, and then enters a loop to read incoming characters and build a string until a newline character is received. It then prints the received string and resets the variables.

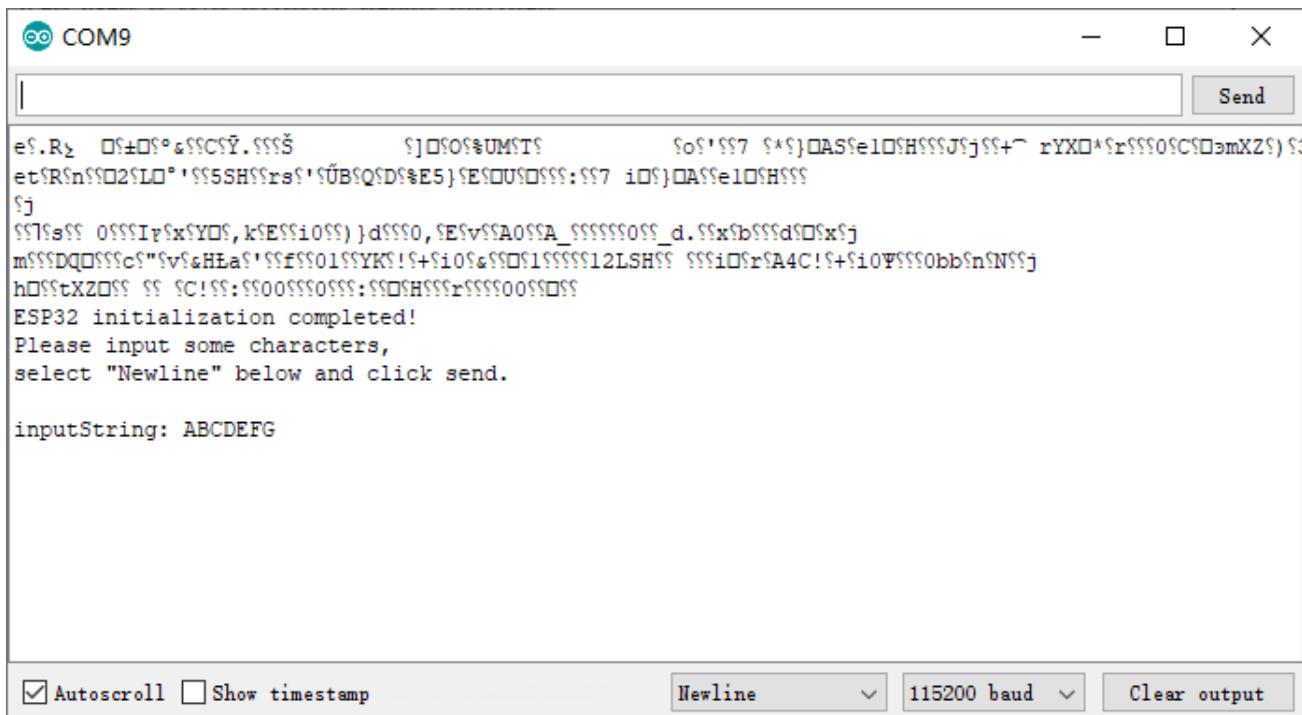

```
String inputString = "";      //a String to hold incoming data
bool stringComplete = false; // whether the string is complete
void setup() {
    Serial.begin(115200);
    Serial.println("\nESP32 initialization completed!\n");
    + String("Please input some characters,\n")
    + String("select \"Newline\" below and click send button. \n"));
}
void loop() {
    if (Serial.available()) {      // judge whether data has been received
        char inChar = Serial.read(); // read one character
        inputString += inChar;
        if (inChar == '\n') {
            stringComplete = true;
        }
    }
    if (stringComplete) {
        Serial.printf("inputString: %s \n", inputString);
        inputString = "";
        stringComplete = false;
    }
}
```

- Status Bar:** Shows "Done uploading.", "Hash of data verified.", "Leaving...", "Hard resetting via RTS pin...", and "ESP32 Wrover Module on COM9".

Download the code to ESP32-WROVER, open the serial monitor, and set the bottom to Newline, 115200. As shown in the following figure:

Then type characters like 'ABCDEG' into the data sent at the top and click the Send button to print out the data ESP32 receives.

The following is the program code:

```

1 String inputString = "";      //a String to hold incoming data
2 bool stringComplete = false; // whether the string is complete
3
4 void setup() {
5     Serial.begin(115200);
6     Serial.println(String("\nESP32 initialization completed! \n")
7                     + String("Please input some characters, \n")
8                     + String("select \"Newline\" below and click send button. \n"));
9 }
10
11 void loop() {
12     if (Serial.available()) {      // judge whether data has been received
13         char inChar = Serial.read();      // read one character
14         inputString += inChar;
15         if (inChar == '\n') {
16             stringComplete = true;
17         }
18     }
19     if (stringComplete) {
20         Serial.printf("inputString: %s \n", inputString);
21         inputString = "";
22         stringComplete = false;
23     }
24 }
```

In loop(), determine whether the serial port has data, if so, read and save the data, and if the newline character is read, print out all the data that has been read.

Reference

String();

Constructs an instance of the String class.

For more information, please visit

<https://www.arduino.cc/reference/en/language/variables/data-types/stringobject/>

int available(void);

Get the number of bytes (characters) available for reading from the serial port. This is data that's already arrived and stored in the serial receive buffer.

Serial.read();

Reads incoming serial data.

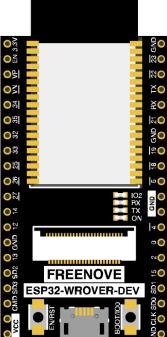

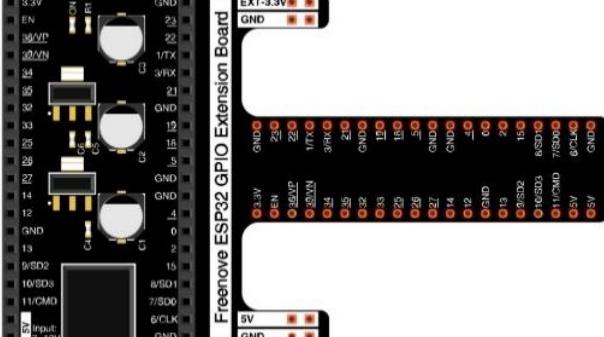

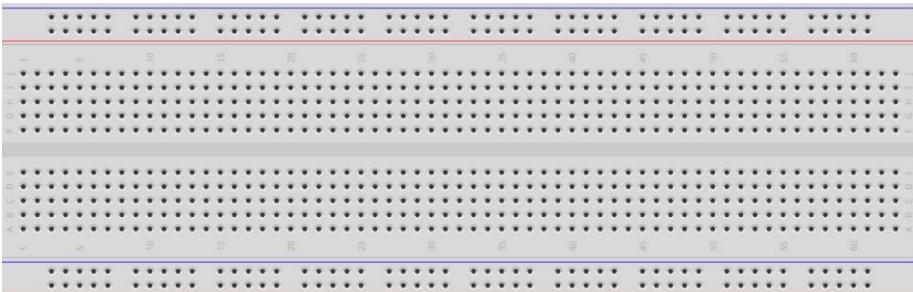

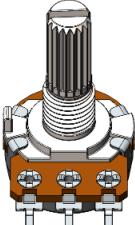

Chapter 8 AD/DA Converter

We have learned how to control the brightness of LED through PWM and understood that PWM is not the real analog before. In this chapter, we will learn how to read analog, convert it into digital and convert the digital into analog output. That is, ADC and DAC.

Project 8.1 Read the Voltage of Potentiometer

In this project, we will use the ADC function of ESP32 to read the voltage value of potentiometer. And then output the voltage value through the DAC to control the brightness of LED.

ADC

An ADC is an electronic integrated circuit used to convert analog signals such as voltages to digital or binary form consisting of 1s and 0s. The range of our ADC on ESP32 is 12 bits, that means the resolution is $2^{12}=4096$, and it represents a range (at 3.3V) will be divided equally to 4096 parts. The range of analog values corresponds to ADC values. So the more bits the ADC has, the denser the partition of analog will be and the greater the precision of the resulting conversion.

Subsection 1: the analog in rang of 0V---3.3/4095 V corresponds to digital 0;

Subsection 2: the analog in rang of 3.3/4095 V---2*3.3 /4095V corresponds to digital 1;

...

The following analog will be divided accordingly.

The conversion formula is as follows:

$$\text{ADC Value} = \frac{\text{Analog Voltage}}{3.3} * 4095$$

DAC

The reversing of this process requires a DAC, Digital-to-Analog Converter. The digital I/O port can output high level and low level (0 or 1), but cannot output an intermediate voltage value. This is where a DAC is useful. ESP32 has two DAC output pins with 8-bit accuracy, GPIO25 and GPIO26, which can divide VDD (here is 3.3V) into $2^8=256$ parts. For example, when the digital quantity is 1, the output voltage value is $3.3/256 * 1$ V, and when the digital quantity is 128, the output voltage value is $3.3/256 * 128=1.65$ V, the higher the accuracy of DAC, the higher the accuracy of output voltage value will be.

The conversion formula is as follows:

$$\text{Analog Voltage} = \frac{\text{DAC Value}}{255} * 3.3 \text{ (V)}$$

ADC on ESP32

ESP32 has two digital analog converters with successive approximations of 12-bit accuracy, and a total of 16 pins can be used to measure analog signals. GPIO pin sequence number and analog pin definition are shown in the following table.

Pin number in Arduino	GPIO number	ADC channel
A0	GPIO 36	ADC1_CH0
A3	GPIO 39	ADC1_CH3
A4	GPIO 32	ADC1_CH4
A5	GPIO 33	ADC1_CH5
A6	GPIO 34	ADC1_CH6
A7	GPIO 35	ADC1_CH7
A10	GPIO 4	ADC2_CH0
A11	GPIO 0	ADC2_CH1
A12	GPIO 2	ADC2_CH2
A13	GPIO 15	ADC2_CH3
A14	GPIO 13	ADC2_CH4
A15	GPIO 12	ADC2_CH5
A16	GPIO 14	ADC2_CH6
A17	GPIO 27	ADC2_CH7
A18	GPIO 25	ADC2_CH8
A19	GPIO 26	ADC2_CH9

The analog pin number is also defined in ESP32's code base. For example, you can replace GPIO36 with A0 in the code.

Note: ADC2 is disabled when ESP32's WiFi function is enabled.

DAC on ESP32

ESP32 has two 8-bit digital analog converters to be connected to GPIO25 and GPIO26 pins, respectively, and it is immutable. As shown in the following table.

Simulate pin number	GPIO number
DAC1	25
DAC2	26

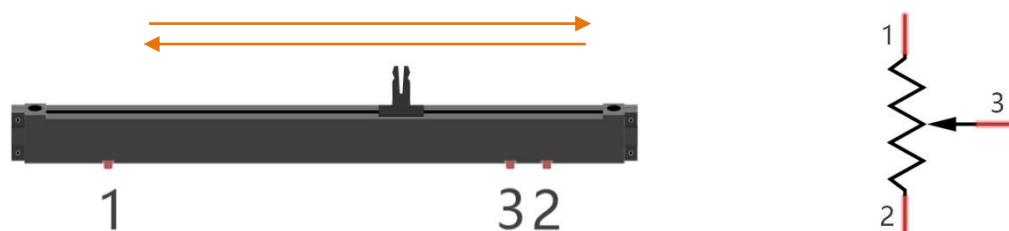

The DAC pin number is already defined in ESP32's code base; for example, you can replace GPIO25 with DAC1 in the code.

Note: In this ESP32, GPIO26 is used as the camera's IIC-SDA pin, which is connected to 3.3V through a resistor. Therefore, DAC2 cannot be used.

Component knowledge

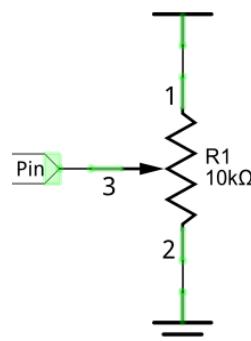

Potentiometer

A potentiometer is a three-terminal resistor. Unlike the resistors that we have used thus far in our project which have a fixed resistance value, the resistance value of a potentiometer can be adjusted. A potentiometer is often made up by a resistive substance (a wire or carbon element) and movable contact brush. When the brush moves along the resistor element, there will be a change in the resistance of the potentiometer's output side (3) (or change in the voltage of the circuit that is a part). The illustration below represents a linear sliding potentiometer and its electronic symbol on the right.

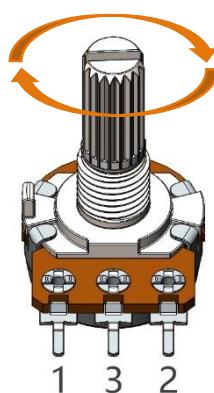

What between potentiometer pin 1 and pin 2 is the resistor body, and pins 3 is connected to brush. When brush moves from pin 1 to pin 2, the resistance between pin 1 and pin 3 will increase up to body resistance linearly, and the resistance between pin 2 and pin 3 will decrease down to 0 linearly.

In the circuit. The both sides of resistance body are often connected to the positive and negative electrode of the power. When you slide the brush pin 3, you can get a certain voltage in the range of the power supply.

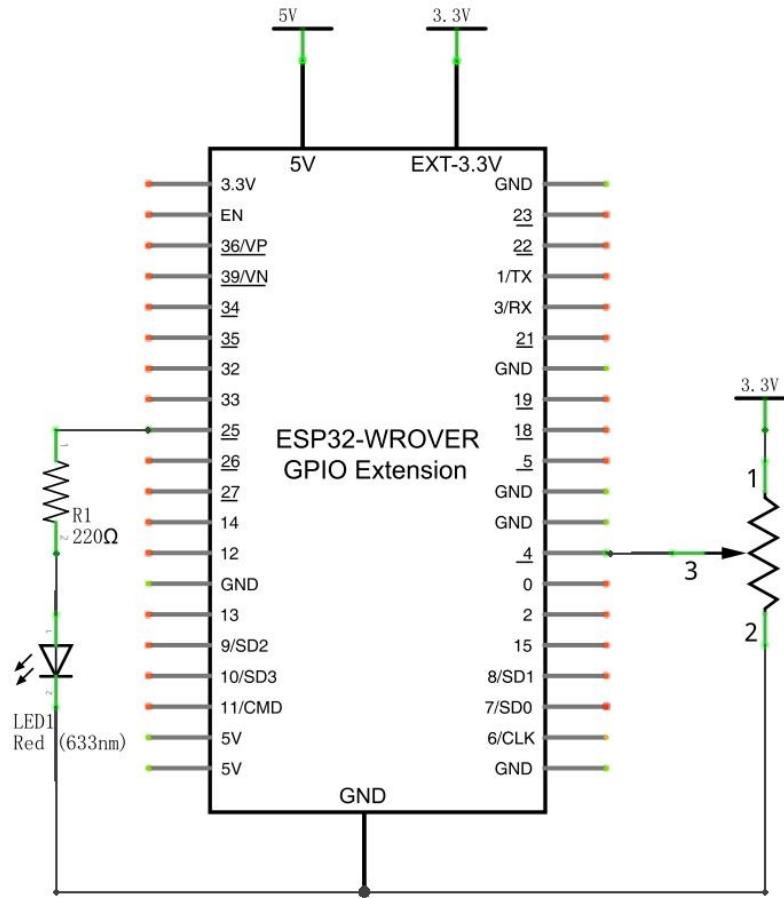

Rotary potentiometer

Rotary potentiometer and linear potentiometer have similar function; their only difference is: the resistance is adjusted by rotating the potentiometer.

ESP32 Dev Module on COM9

Download the code to ESP32-WROVER, open the serial monitor, and set the baud rate to 115200. As shown in the following figure,

ADC Val	DAC Val	Voltage
1344	83	1.08V
1345	83	1.08V
1328	82	1.07V
1344	83	1.08V
1344	83	1.08V
1344	83	1.08V
1345	83	1.08V
1344	83	1.08V
1321	82	1.06V

Autoscroll Show timestamp No line ending 115200 baud Clear output

The serial monitor prints ADC values, DAC values, and the output voltage of the potentiometer. In the code, we made the voltage output from the DAC pin equal to the voltage input from the ADC pin. Rotate the handle of the potentiometer and the print will change. When the voltage is greater than 1.6V (voltage needed to turn on red LED), LED starts emitting light. If you continue to increase the output voltage, the LED will become more and more brighter. When the voltage is less than 1.6v, the LED will not light up, because it does not reach the voltage to turn on LED, which indirectly proves the difference between DAC and PWM. (if you have an oscilloscope, you can check the waveform of the DAC output through it.)

The following is the code:

```

1 #define PIN_ANALOG_IN 4
2
3 void setup() {
4     Serial.begin(115200);
5 }
6
7 void loop() {
8     int adcVal = analogRead(PIN_ANALOG_IN);
9     int dacVal = map(adcVal, 0, 4095, 0, 255);
10    double voltage = adcVal / 4095.0 * 3.3;
11    dacWrite(DAC1, dacVal);
12    Serial.printf("ADC Val: %d, \t DAC Val: %d, \t Voltage: %.2fV\n", adcVal, dacVal, voltage);
13    delay(200);
14 }
```

In loop(), the analogRead() function is used to obtain the ADC value, and then the map() function is used to convert the value into an 8-bit precision DAC value. The function dacWrite() is used to output the value. The input and output voltage are calculated according to the previous formula, and the information is finally printed out.

```

8 int adcVal = analogRead(PIN_ANALOG_IN);
9 int dacVal = map(adcVal, 0, 4095, 0, 255);
10 double voltage = adcVal / 4095.0 * 3.3;
11 dacWrite(DAC1, dacVal);
12 Serial.printf("ADC Val: %d, \t DAC Val: %d, \t Voltage: %.2fV\n", adcVal, dacVal, voltage);
```

Reference

`uint16_t analogRead(uint8_t pin);`

Reads the value from the specified analog pin. Return the analog reading on the pin. (0-4095 for 12 bits).

`void dacWrite(uint8_t pin, uint8_t value);`

This writes the given value to the supplied analog pin.

`long map(long value, long fromLow, long fromHigh, long toLow, long toHigh);`

Re-maps a number from one range to another. That is, a value of fromLow would get mapped to toLow, a value of fromHigh to toHigh, values in-between to values in-between, etc.

Project 8.2 Get Voltage (use idf)

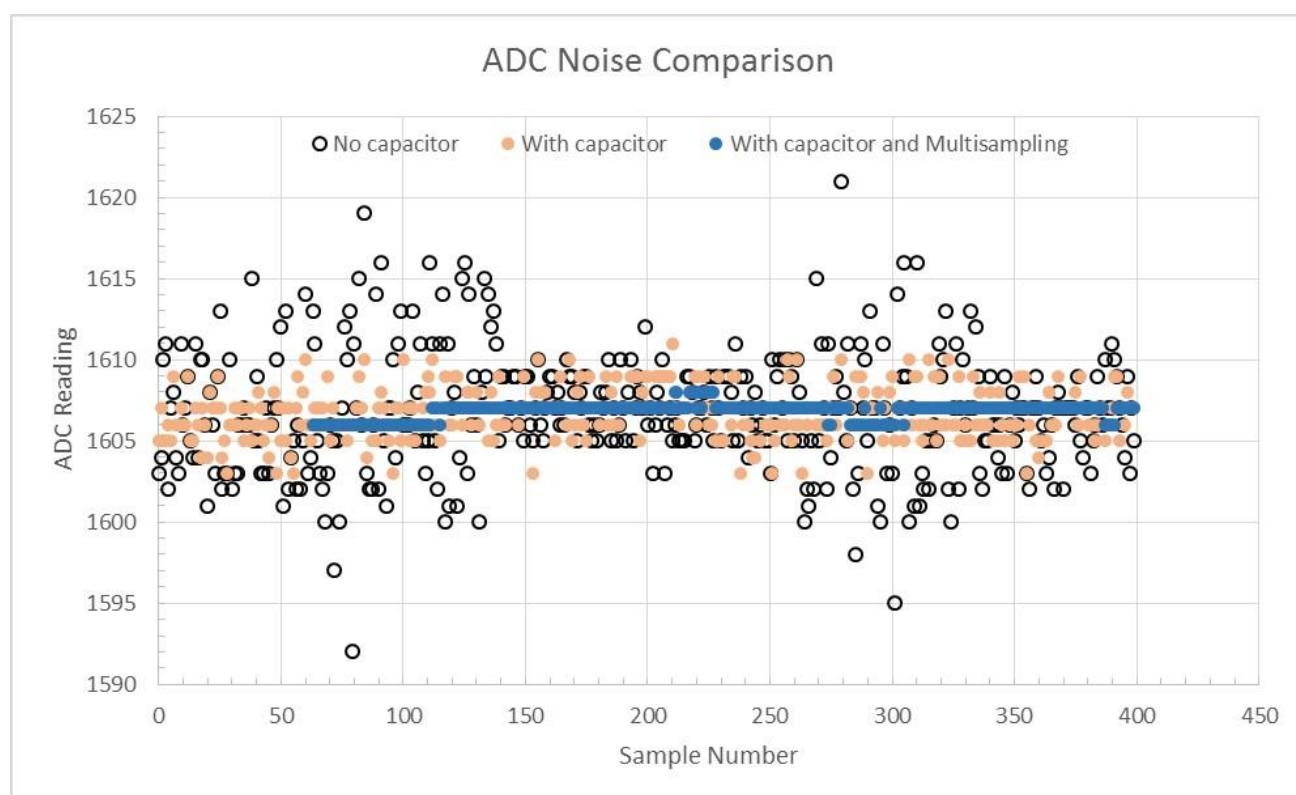

If you have a voltmeter, in the previous project, you may discover there is a slight error between the voltage values for ESP32 and the voltmeter values.

ESP32 provides ADC calibration, but the Arduino code base doesn't use it. The functions in the IDF-SDK library help to obtain more accurate ADC and voltage values.

Related Knowledge

Minimizing Noise

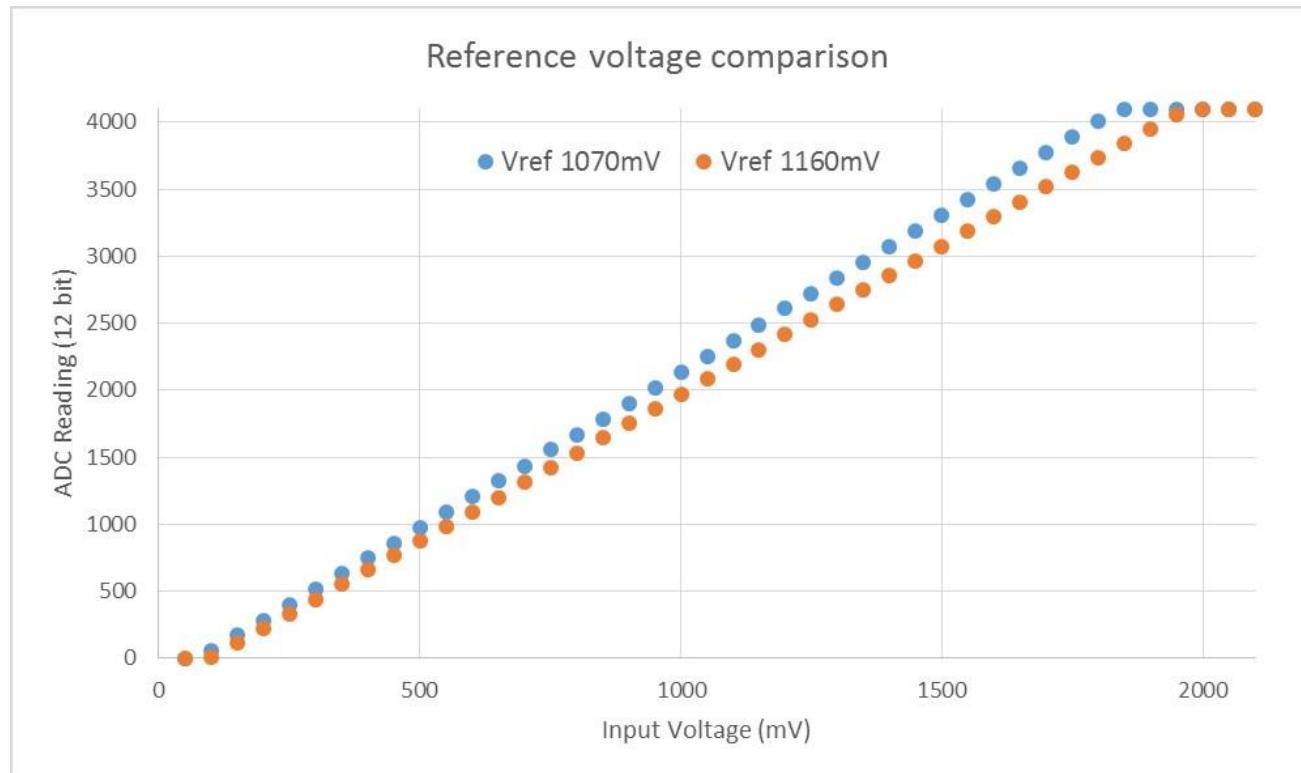

The ESP32 ADC's sensitive to noise will lead to large discrepancies in ADC readings. To minimize noise, users may connect a 0.1uF capacitor to the ADC input pad in use. Multisampling may also be used to further mitigate the effects of noise.

Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

ADC Calibration

The [esp_adc_cal/include/esp_adc_cal.h](#) API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages (Vref) between chips. The designed ADC reference voltage is 1100mV, however the true reference voltage can range from 1000mV to 1200mV amongst different ESP32s.

Graph illustrating the effect of differing reference voltages on the ADC voltage curve.

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The characteristics curve is in the form of $y = \text{coeff_a} * x + \text{coeff_b}$ and is used to convert ADC readings to voltages in mV. Calculation of the characteristics curve is based on calibration values, which can be stored in eFuse or provided by the user.

66         printf("eFuse Vref: Supported\n");
67     }
68     else {
69         printf("eFuse Vref: NOT supported\n");
70     }
71 }

72 }

73 void print_char_val_type(esp_adc_cal_value_t val_type)
74 {
75     if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
76         printf("Characterized using Two Point Value\n");
77     }
78     else if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
79         printf("Characterized using eFuse Vref\n");
80     }
81     else {
82         printf("Characterized using Default Vref\n");
83     }
84 }
85 }
```

For most ADC related applications, `analogRead()` is sufficient. This method can be used in applications where ADC conversion accuracy is required.

About the project used in the IDF API, here is a detailed description:

<https://docs.espressif.com/projects/esp-idf/en/latest/api-reference/peripherals/adc.html>

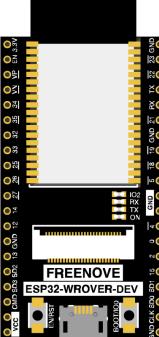

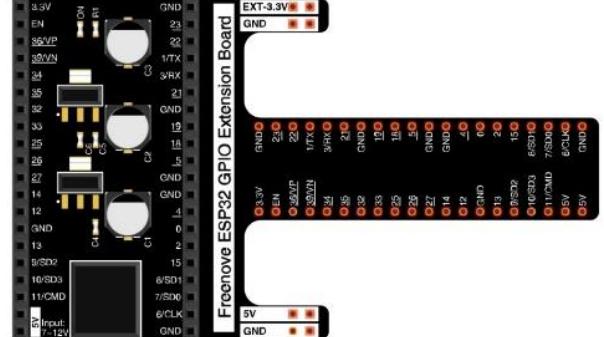

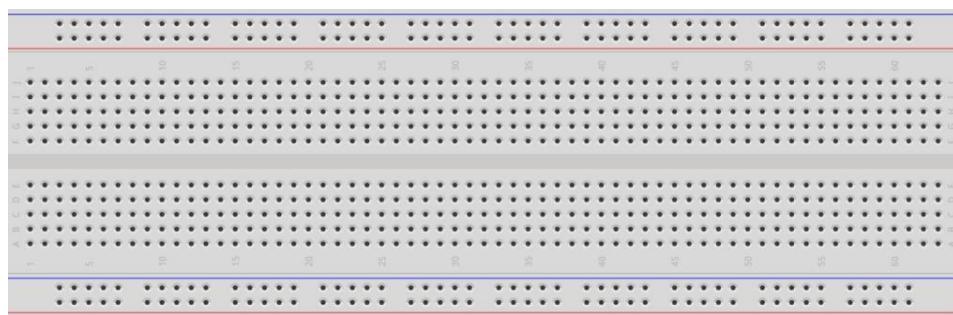

Chapter 9 Touch Sensor

ESP32 offers up to 10 capacitive touch GPIO, and as you can see from the previous section, mechanical switches are prone to jitter that must be eliminated when used, which is not the case with ESP32's built-in touch sensor. In addition, on the service life, the touch switch also has advantages that mechanical switch is completely incomparable.

Project 9.1 Read Touch Sensor

This project reads the value of the touch sensor and prints it out.

Component List

ESP32-WROVER x1	GPIO Extension Board x1

Jumper M/M x1	

Related knowledge

Touch sensor

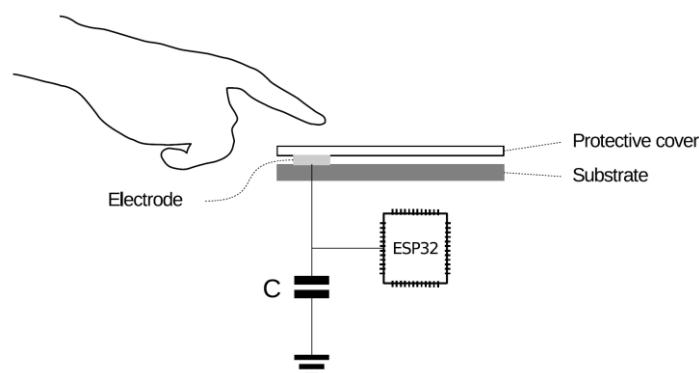

ESP32's touch sensor supports up to 10 GPIO channels as capacitive touch pins. Each pin can be used separately as an independent touch switch or be combined to produce multiple touch points. The following table is a list of available touch pins on ESP32.

Name of touch sensing signal	Functions of pins	GPIO number
T0	GPIO4	GPIO4
T1	GPIO0	GPIO0
T2	GPIO2	GPIO2
T3	MTDO	GPIO15
T4	MTCK	GPIO13
T5	MTDI	GPIO12
T6	MTMS	GPIO14
T7	GPIO27	GPIO27
T8	32K_XN	GPIO33
T9	32K_XP	GPIO32

The touch pin number is already defined in ESP32's code base. For example, in the code, you can use T0 to represent GPIO4.

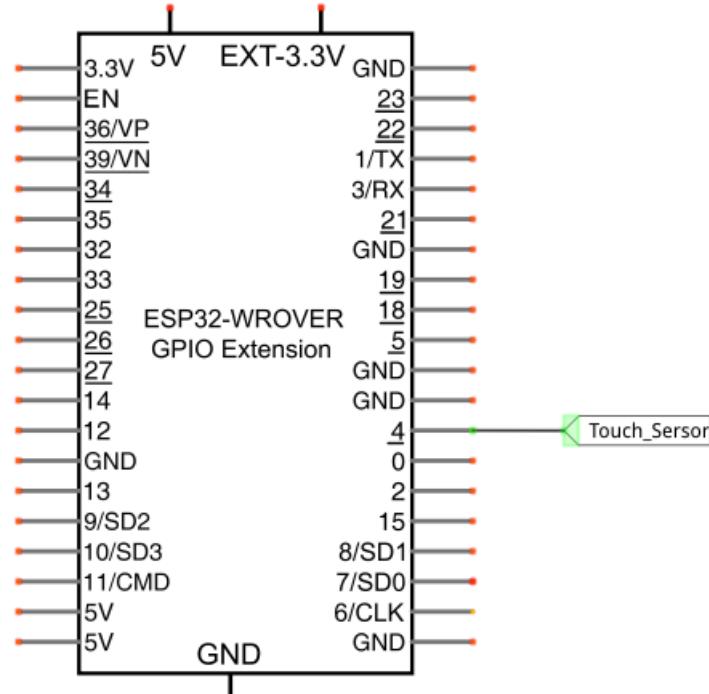

The electrical signals generated by touch are analog data, which are converted by an internal ADC converter. You may have noticed that all touch pins have ADC functionality.

The hardware connection method is shown in the following figure.

7
8 void setup()
9 {
10   Serial.begin(115200);
11 }
12
13 void loop()
14 {
15   Serial.printf("Touch value: %d \n",touchRead(T0)); // get value using T0 (GPIO4)
16   delay(1000);
17 }
```
- Status Bar:** Done Saving.
- Serial Monitor:** Shows the message "Leaving... Hard resetting via RTS pin..." followed by a timestamp "12 ESP32 Wrover Module on COM5".

Download the code to ESP32-WROVER, open the serial monitor, and set the baud rate to 115200. As shown in the following figure,

Touched by hands, the value of the touch sensor will change. The closer the value is to zero, the more obviously the touch action will be detected. The value detected by the sensor may be different in different environments or when different people touch it. The code is very simple, just look at Reference.

Reference

```
uint16_t touchRead(uint8_t pin);
```

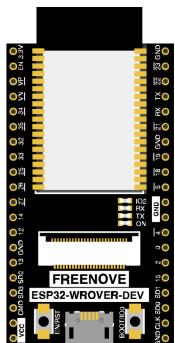

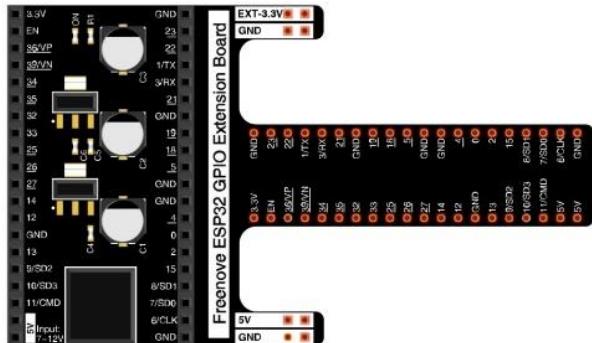

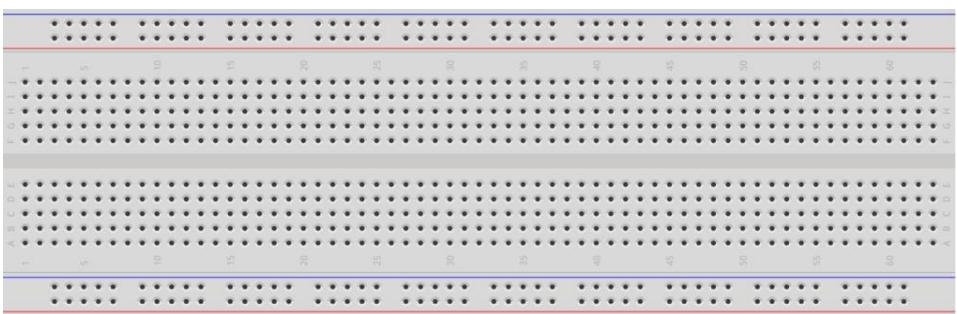

Read touch sensor value. (values close to 0 mean touch detected)

ESP32 Wrover Module on COM5

Download the code to ESP32-WROVER, open the serial monitor, and set the baud rate to 115200. As shown in the following figure,

With a touch pad, the state of the LED changes with each touch, and the detection state of the touch sensor is printed in the serial monitor.

The following is the program code:

```

1 #define PIN_LED 2
2 #define PRESS_VAL 14 //Set a threshold to judge touch
3 #define RELEASE_VAL 25//Set a threshold to judge release
4
5 bool isProcessed = false;
6 void setup() {
7     Serial.begin(115200);
8     pinMode(PIN_LED, OUTPUT);
9 }
10 void loop() {
11     if (touchRead(T0) < PRESS_VAL) {
12         if (!isProcessed) {
13             isProcessed = true;
14             Serial.println("Touch detected! ");
15             reverseGPIO(PIN_LED);
16         }
17     }
18
19     if (touchRead(T0) > RELEASE_VAL) {
20         if (isProcessed) {
21             isProcessed = false;
22             Serial.println("Released! ");
23         }
24     }
}

```

```
25 }  
26  
27 void reverseGPIO(int pin) {  
28     digitalWrite(pin, ! digitalRead(pin));  
29 }
```

The closer the return value of the function touchRead() is to 0, the more obviously the touch is detected. This is not a fixed value, so you need to define a threshold that is considered valid (when the value of the sensor is less than this threshold). Similarly, a threshold value is to be defined in the release state, and a value in between is considered an invalid disturbance value.

```
2 #define PRESS_VAL 14 //Set a threshold to judge touch  
3 #define RELEASE_VAL 25//Set a threshold to judge release
```

In loop(), first determine whether the touch was detected. If yes, print some messages, flip the state of the LED, and set the flag bit **isProcessed** to true to avoid repeating the program after the touch was successful.

```
11 if (touchRead(T0) < PRESS_VAL) {  
12     if (! isProcessed) {  
13         isProcessed = true;  
14         Serial.println("Touch detected! ");  
15         reverseGPIO(PIN_LED);  
16     }  
17 }
```

It then determines if the touch key is released, and if so, prints some messages and sets the **isProcessed** to false to avoid repeating the process after the touch release and to prepare for the next touch probe.

```
19 if (touchRead(T0) > RELEASE_VAL) {  
20     if (isProcessed) {  
21         isProcessed = false;  
22         Serial.println("Released! ");  
23     }  
24 }
```

Chapter 10 Potentiometer & LED

We have learned how to use ADC and DAC before. When using DAC output analog to drive LED, we found that, when the output voltage is less than led turn-on voltage, the LED does not light; when the output analog voltage is greater than the LED voltage, the LED lights. This leads to a certain degree of waste of resources. Therefore, in the control of LED brightness, we should choose a more reasonable way of PWM control. In this chapter, we learn to control the brightness of LED through a potentiometer.

Project 10.1 Soft Light

In this project, we will make a soft light. We will use an ADC Module to read ADC values of a potentiometer and map it to duty cycle of the PWM used to control the brightness of a LED. Then you can change the brightness of a LED by adjusting the potentiometer.

Component List

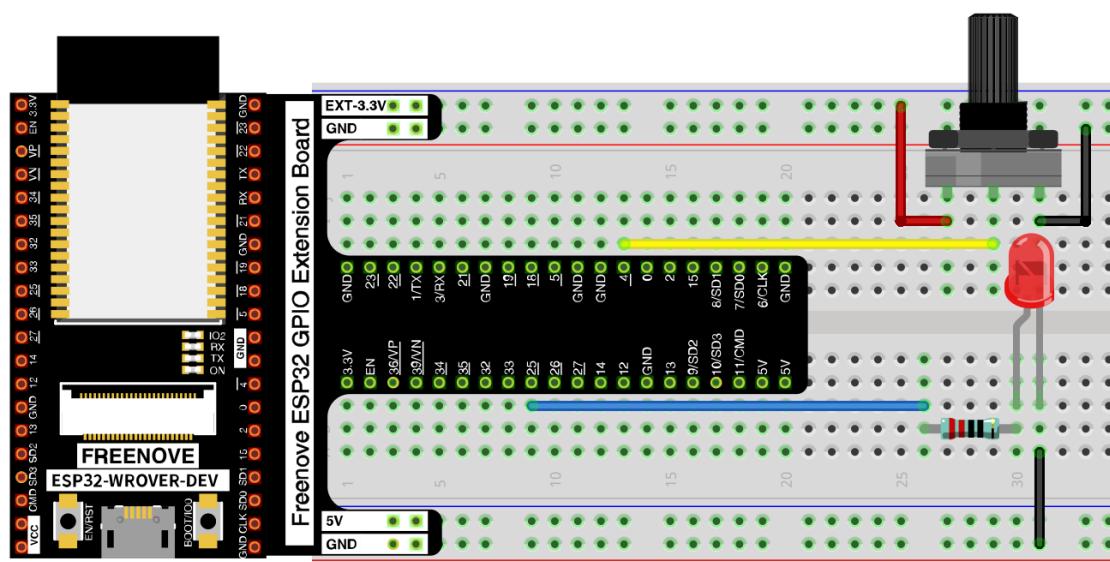

ESP32-WROVER x1	GPIO Extension Board x1		
Breadboard x1			
Rotary potentiometer x1	Resistor 220Ω x1	LED x1	Jumper M/M x5

Circuit

Hard resetting via RTS pin...

```

ESP32 Dev Module on COM9

Download the code to ESP32-WROVER, by turning the adjustable resistor to change the input voltage of GPIO25, ESP32 changes the output voltage of GPIO4 according to this voltage value, thus changing the brightness of the LED.

The following is the code:

```

1 #define PIN_ANALOG_IN 4
2 #define PIN_LED 25
3 #define CHAN 0
4 void setup() {
5   ledcSetup(CHAN, 1000, 12);
6   ledcAttachPin(PIN_LED, CHAN);
7 }
8
9 void loop() {
10   int adcVal = analogRead(PIN_ANALOG_IN); //read adc
11   int pwmVal = adcVal; // adcVal re-map to pwmVal
12   ledcWrite(CHAN, pwmVal); // set the pulse width.
13   delay(10);
14 }

```

In the code, read the ADC value of potentiometer and map it to the duty cycle of PWM to control LED brightness.

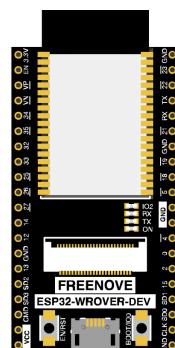

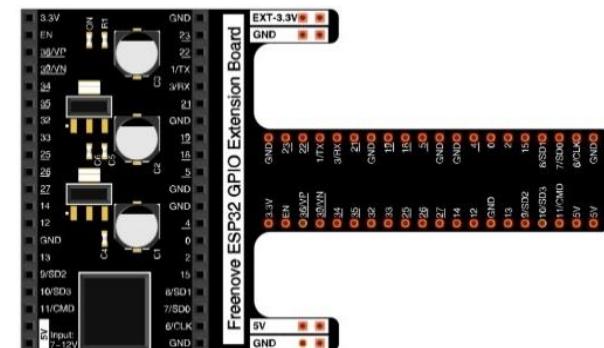

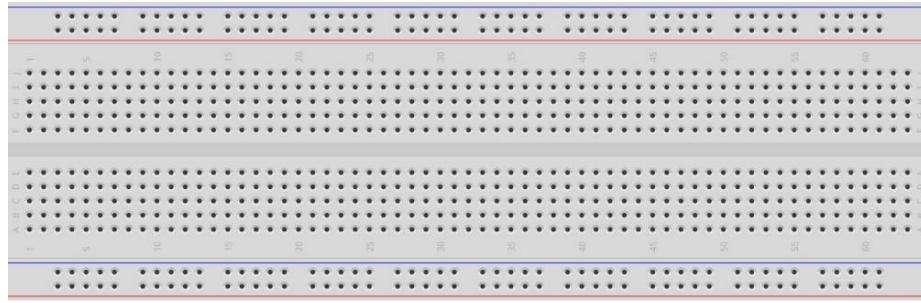

Chapter 11 Photoresistor & LED

In this chapter, we will learn how to use a photoresistor.

Project 11.1 NightLamp

A photoresistor is very sensitive to the amount of light present. We can take advantage of the characteristic to make a nightlight with the following function: when the ambient light is less (darker environment) the LED will automatically become brighter to compensate and when the ambient light is greater (brighter environment) the LED will automatically dim to compensate.

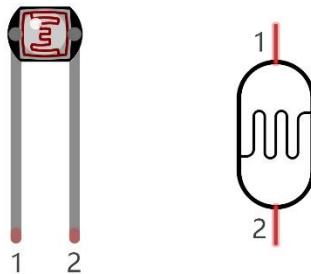

Component List

ESP32-WROVER x1	GPIO Extension Board x1
	
	
Breadboard x1	
	
Photoresistor x1	Resistor
	
220Ω x1 10KΩ x1	
	
LED x1	
	
Jumper M/M x4	

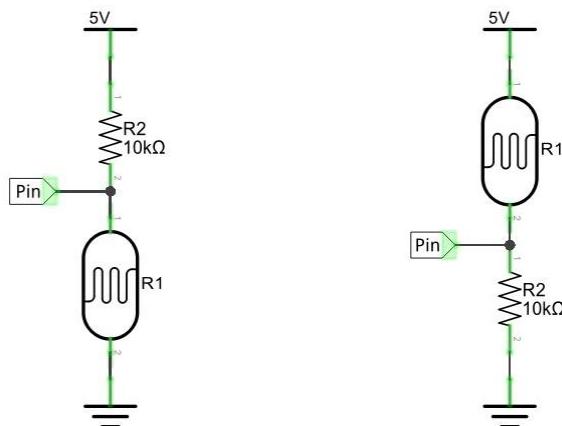

Component knowledge

Photoresistor

A photoresistor is simply a light sensitive resistor. It is an active component that decreases resistance with respect to receiving luminosity (light) on the component's light sensitive surface. A photoresistor's resistance value will change in proportion to the ambient light detected. With this characteristic, we can use a photoresistor to detect light intensity. The photoresistor and its electronic symbol are as follows.

The circuit below is used to detect the change of a photoresistor's resistance value:

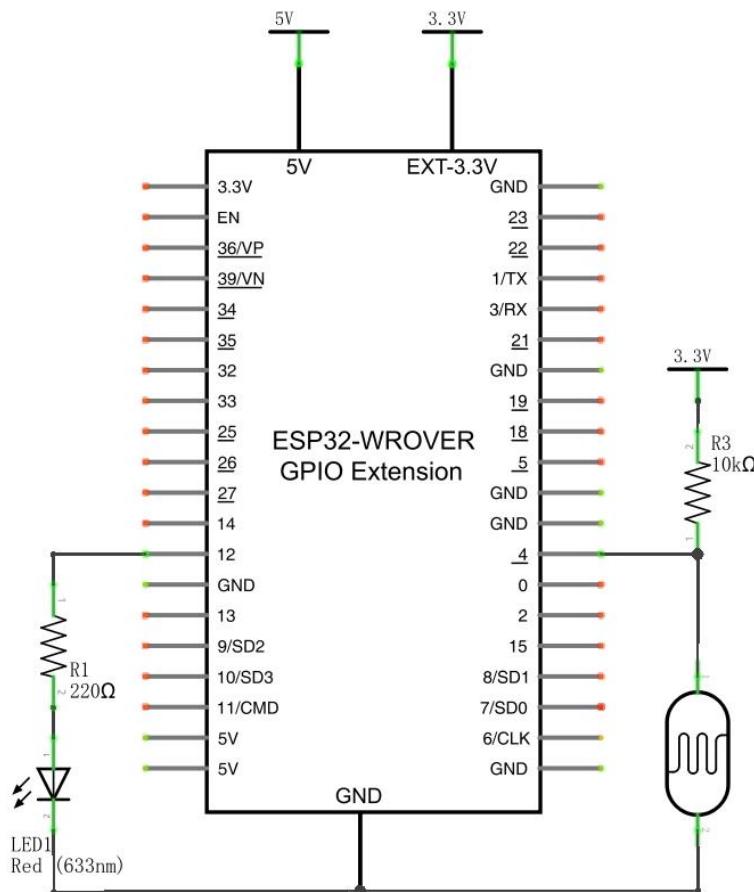

In the above circuit, when a photoresistor's resistance value changes due to a change in light intensity, the voltage between the photoresistor and resistor R1 will also change. Therefore, the intensity of the light can be obtained by measuring this voltage.

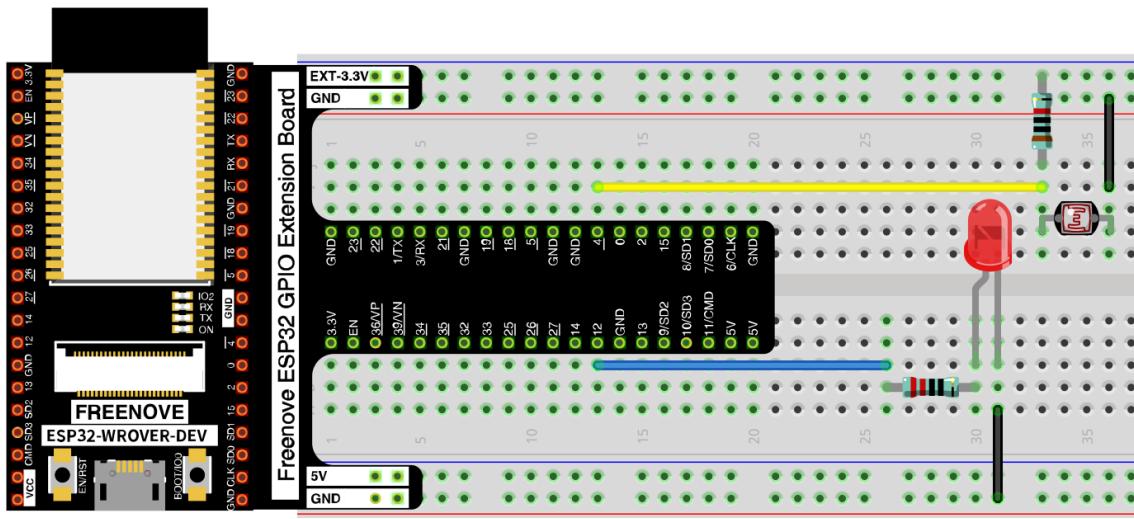

Circuit

The circuit of this project is similar to project Soft Light. The only difference is that the input signal is changed from a potentiometer to a combination of a photoresistor and a resistor.

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: support@freenove.com

Any concerns?  support@freenove.com

Sketch

The circuit used is similar to the project Soft Light. The only difference is that the input signal of the AIN0 pin of ADC changes from a potentiometer to a combination of a photoresistor and a resistor.

Sketch_11.1_Nightlamp

The screenshot shows the Arduino IDE interface. The top menu bar includes File, Edit, Sketch, Tools, and Help. The main window displays the code for 'Sketch_12.1_NightLamp' with the following content:

```

8     ledcAttachPin(PIN_LED, CHAN);
9 }
10
11 void loop() {
12     int adcVal = analogRead(PIN_ANALOG_IN); //read adc
13     int pwmVal = map(constrain(adcVal, LIGHT_MIN, LIGHT_MAX), LIGHT_MIN, LIGHT_MAX, 0, 4095);
// adcVal re-map to pwmVal
15     ledcWrite(CHAN, pwmVal); // set the pulse width.
16     delay(10);
17 }
```

Reference

```
constrain(amt, low, high)
#define constrain(amt, low, high) ((amt)<(low)? (low) : ((amt)>(high)? (high) : (amt)))
Constrain the value amt between low and high.
```

Chapter 12 Thermistor

In this chapter, we will learn about thermistors which are another kind of resistor

Project 12.1 Thermometer

A thermistor is a type of resistor whose resistance value is dependent on temperature and changes in temperature. Therefore, we can take advantage of this characteristic to make a thermometer.

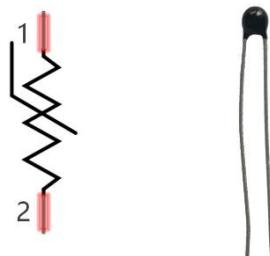

Component List

ESP32-WROVER x1	GPIO Extension Board x1	
Breadboard x1		
Thermistor x1	Resistor 10kΩ x1	Jumper M/M x3

Component knowledge

Thermistor

A thermistor is a temperature sensitive resistor. When it senses a change in temperature, the resistance of the thermistor will change. We can take advantage of this characteristic by using a thermistor to detect temperature intensity. A thermistor and its electronic symbol are shown below.

The relationship between resistance value and temperature of a thermistor is:

$$R_t = R * \text{EXP} \left[B * \left(\frac{1}{T_2} - \frac{1}{T_1} \right) \right]$$

Where:

R_t is the thermistor resistance under T_2 temperature;

R is the nominal resistance of thermistor under T_1 temperature;

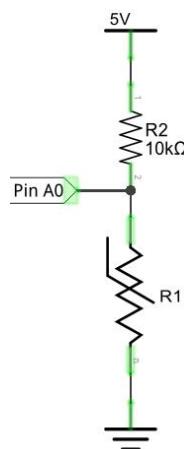

$\text{EXP}[n]$ is nth power of E;

B is for thermal index;

T_1, T_2 is Kelvin temperature (absolute temperature). Kelvin temperature=273.15 + Celsius temperature.

For the parameters of the thermistor, we use: $B=3950$, $R=10k$, $T_1=25$.

The circuit connection method of the thermistor is similar to photoresistor, as the following:

We can use the value measured by the ADC converter to obtain the resistance value of thermistor, and then we can use the formula to obtain the temperature value.

Therefore, the temperature formula can be derived as:

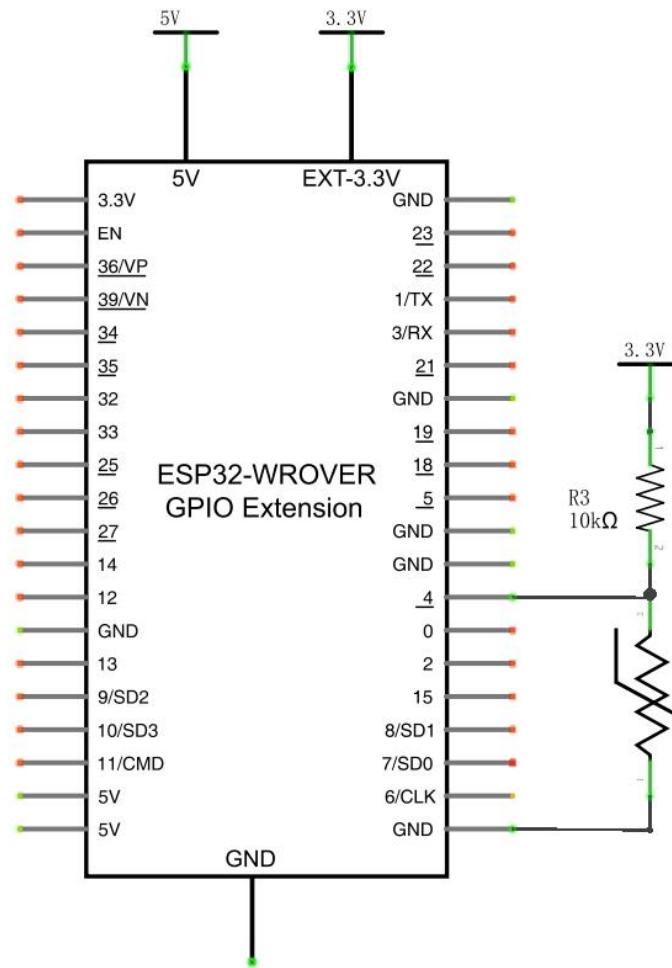

$$T_2 = 1 / \left(\frac{1}{T_1} + \ln \left(\frac{R_t}{R} \right) / B \right)$$

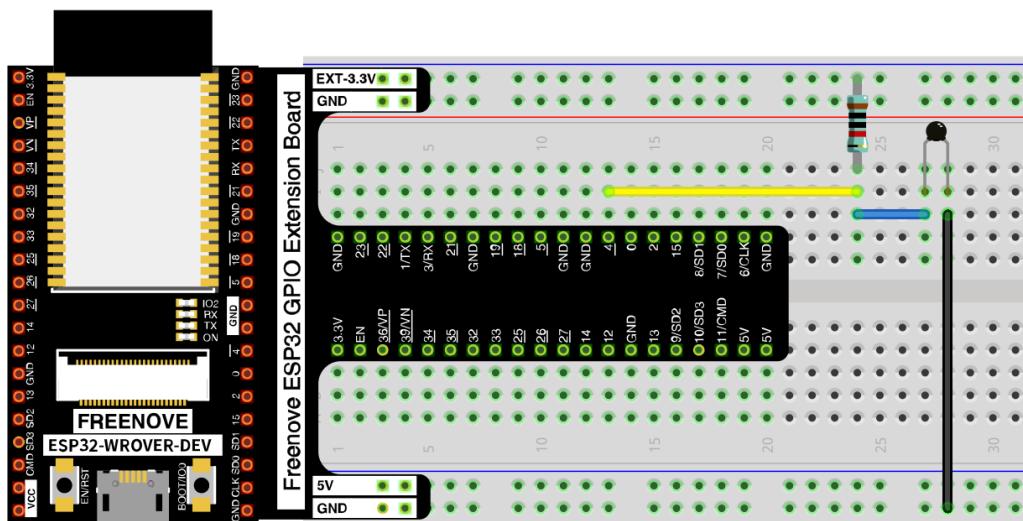

Circuit

The circuit of this project is similar to the one in the last chapter. The only difference is that the photoresistor is replaced by the thermistor.

Any concerns? [✉ support@freenove.com](mailto:support@freenove.com)

The following is the code:

```
1 #define PIN_ANALOG_IN 4
2 void setup() {
3     Serial.begin(115200);
4 }
5
6 void loop() {
7     int adcValue = analogRead(PIN_ANALOG_IN);           //read ADC pin
8     double voltage = (float)adcValue / 4095.0 * 3.3;    // calculate voltage
9     double Rt = 10 * voltage / (3.3 - voltage);        //calculate resistance value of thermistor
10    double tempK = 1 / (1/(273.15 + 25) + log(Rt / 10)/3950.0); //calculate temperature (Kelvin)
11    double tempC = tempK - 273.15;                     //calculate temperature (Celsius)
12    Serial.printf("ADC value : %d, \tVoltage : %.2fV, \tTemperature : %.2fC\n", adcValue,
13    voltage, tempC);
14 }
```

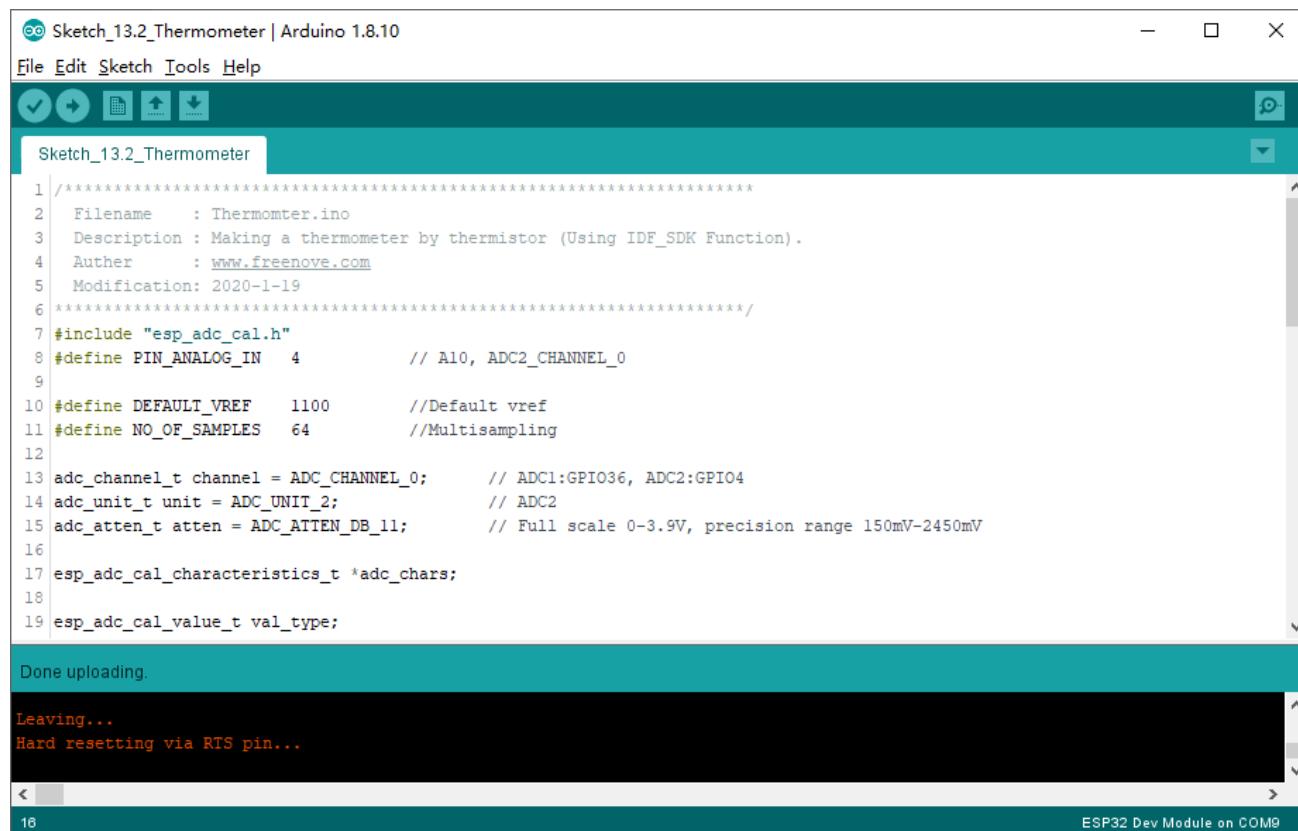

In the code, the ADC value of ADC module A0 port is read, and then calculates the voltage and the resistance of thermistor according to Ohms Law. Finally, it calculates the temperature sensed by the thermistor, according to the formula.

Project 12.2 Thermometer (use esp-idf)

This project uses the function in esp-idf to get more accurate temperature value. The circuit is exactly the same as the last project.

Sketch

Sketch_12.2_Thermometer

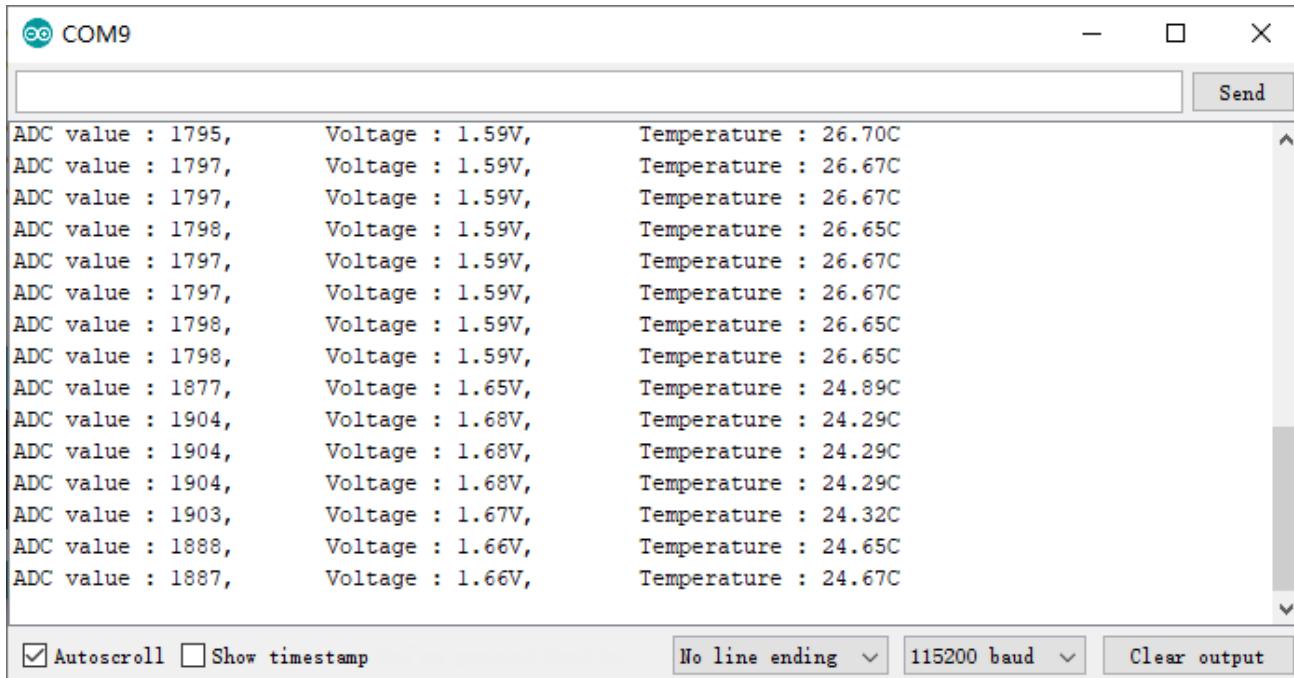

The screenshot shows the Arduino IDE interface with the following details:

46     adc_reading /= NUM_OF_SAMPLES;
47     //Convert adc_reading to voltage in mV
48     uint32_t voltage = esp_adc_cal_raw_to_voltage(adc_reading, adc_chars);
49     //printf("Raw: %d\nVoltage: %dmV\n", adc_reading, voltage);
50
51     double vol = voltage / 1000.0f;
52     double Rt = 10 * vol / (3.3 - vol); //calculate resistance value of thermistor
53     double tempK = 1 / (1 / (273.15 + 25) + log(Rt / 10) / 3950.0); //calculate temperature
54     (Kelvin)
55     double tempC = tempK - 273.15; //calculate temperature (Celsius)
56     Serial.printf("ADC value : %d, \nVoltage : %.2fV, \nTemperature : %.2fC\n", adc_reading,
57     vol, tempC);
58
59 }
```

The part of the code that captures the ADC is consistent with the previous potentiometer section, and the part that calculates the temperature is consistent with the previous project.

Chapter 13 Joystick

In the previous chapter, we have learned how to use rotary potentiometer. Now, let's learn a new electronic module joystick which working on the same principle as rotary potentiometer.

Project 13.1 Joystick

In this project, we will read the output data of a joystick and display it to the Terminal screen.

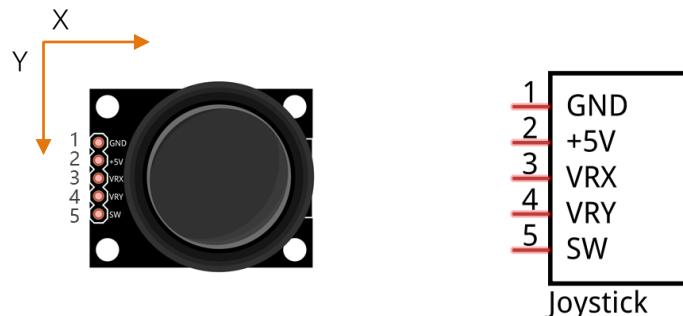

Component List

ESP32-WROVER x1	GPIO Extension Board x1
Breadboard x1	
Joystick x1	Jumper F/M x5

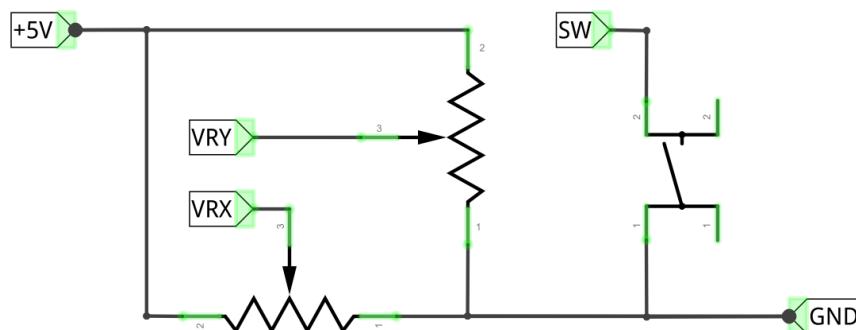

Component knowledge

Joystick

A joystick is a kind of input sensor used with your fingers. You should be familiar with this concept already as they are widely used in gamepads and remote controls. It can receive input on two axes (Y and or X) at the same time (usually used to control direction on a two dimensional plane). And it also has a third direction capability by pressing down (Z axis/direction).

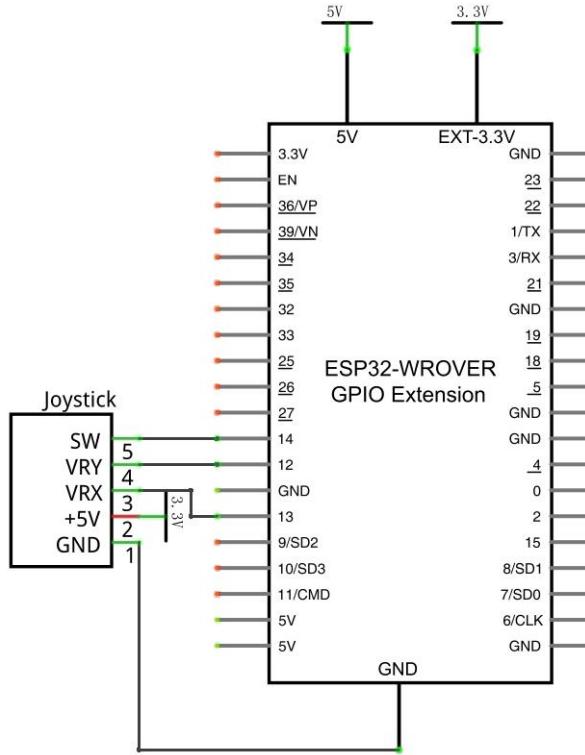

This is accomplished by incorporating two rotary potentiometers inside the joystick Module at 90 degrees of each other, placed in such a manner as to detect shifts in direction in two directions simultaneously and with a push button switch in the “vertical” axis, which can detect when a User presses on the Joystick.

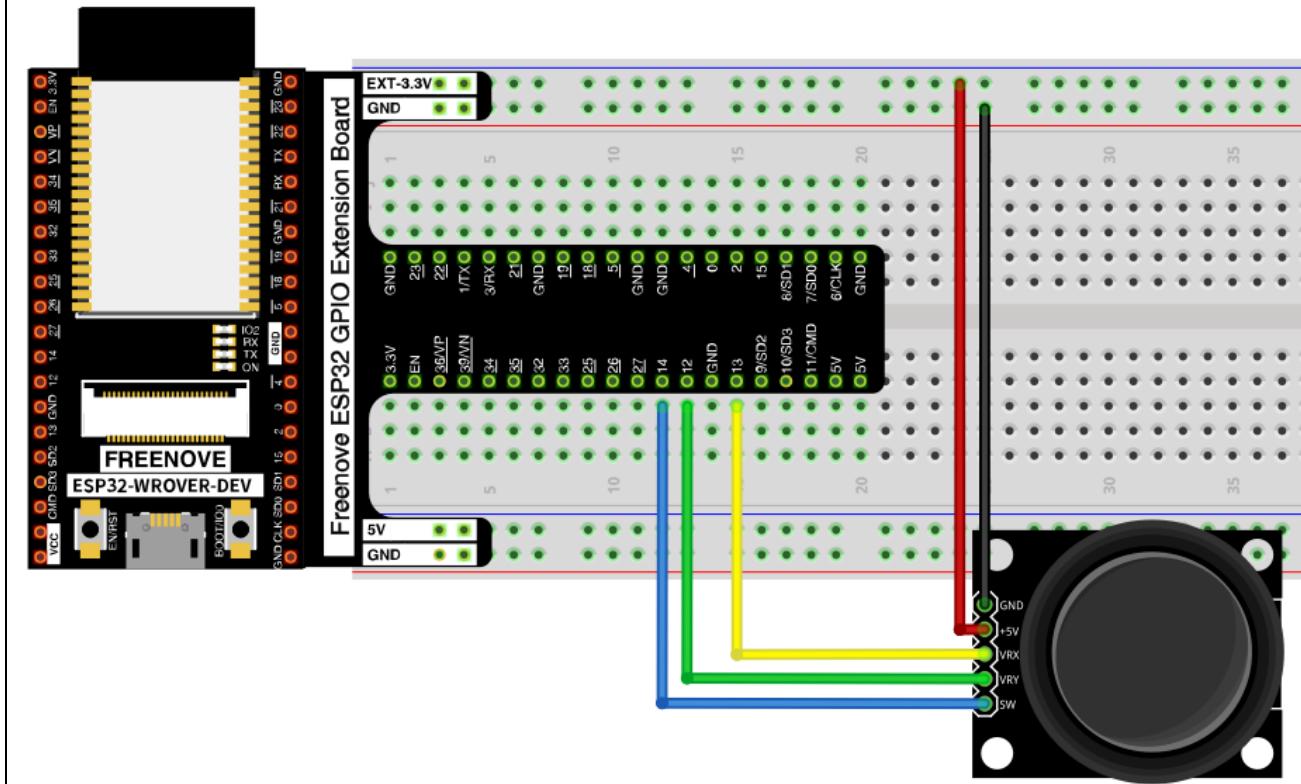

When the joystick data is read, there are some differences between the axes: data of X and Y axes is analog, which needs to use the ADC. The data of the Z axis is digital, so you can directly use the GPIO to read this data or you have the option to use the ADC to read this.

Any concerns? [✉ support@freenove.com](mailto:support@freenove.com)

The following is the code:

```
1 int xyzPins[] = {13, 12, 14}; //x, y, z pins
2 void setup() {
3     Serial.begin(115200);
4     pinMode(xyzPins[2], INPUT_PULLUP); //z axis is a button.
5 }
6
7 void loop() {
8     int xVal = analogRead(xyzPins[0]);
9     int yVal = analogRead(xyzPins[1]);
10    int zVal = digitalRead(xyzPins[2]);
11    Serial.printf("X, Y, Z: %d, \t%d, \t%d\n", xVal, yVal, zVal);
12    delay(500);
13 }
```

In the code, configure xyzPins[2] to pull-up input mode. In loop(), use analogRead () to read the value of axes X and Y and use digitalWrite () to read the value of axis Z, then display them.

```
8 int xVal = analogRead(xyzPins[0]);
9 int yVal = analogRead(xyzPins[1]);
10 int zVal = digitalRead(xyzPins[2]);
11 Serial.printf("X, Y, Z: %d, \t%d, \t%d\n", xVal, yVal, zVal);
12 delay(500);
```

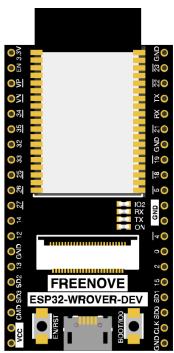

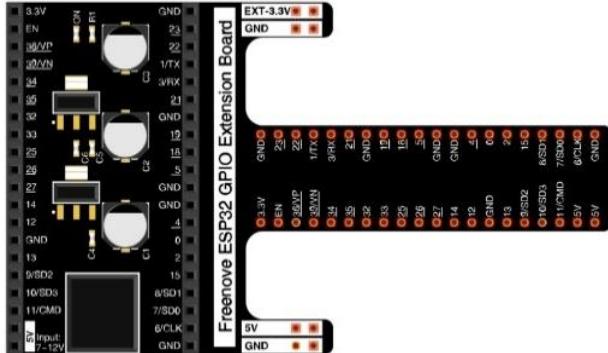

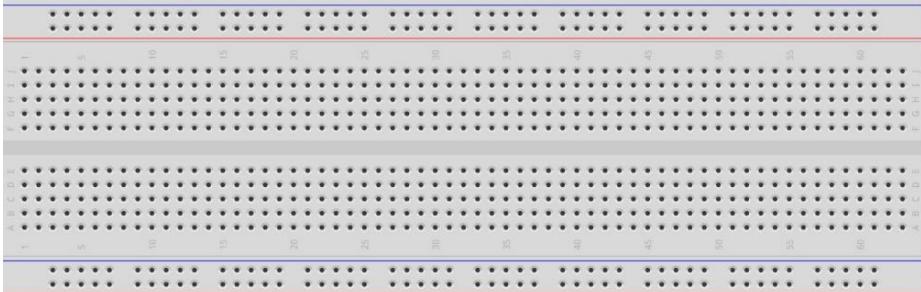

Chapter 14 74HC595 & LED Bar Graph

We have used LED bar graph to make a flowing water light, in which 10 GPIO ports of ESP32 is occupied. More GPIO ports mean that more peripherals can be connected to ESP32, so GPIO resource is very precious. Can we make flowing water light with less GPIO? In this chapter, we will learn a component, 74HC595, which can achieve the target.

Project 14.1 Flowing Water Light

Now let's learn how to use the 74HC595 IC chip to make a flowing water light using less GPIO.

Related knowledge

74HC595

A 74HC595 chip is used to convert serial data into parallel data. A 74HC595 chip can convert the serial data of one byte into 8 bits, and send its corresponding level to each of the 8 ports correspondingly. With this characteristic, the 74HC595 chip can be used to expand the IO ports of a ESP32. At least 3 ports are required to control the 8 ports of the 74HC595 chip.

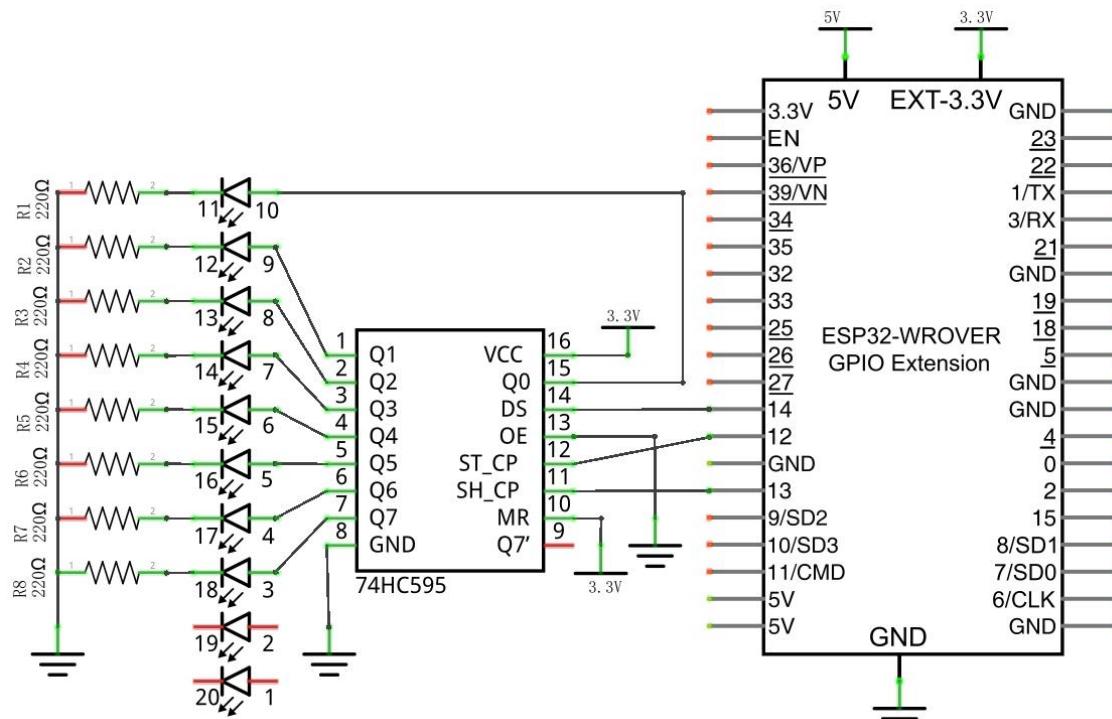

The ports of the 74HC595 chip are described as follows:

Pin name	GPIO number	Description
Q0-Q7	15, 1-7	Parallel data output
VCC	16	The positive electrode of power supply, the voltage is 2~6V
GND	8	The negative electrode of power supply
DS	14	Serial data Input
OE	13	Enable output, When this pin is in high level, Q0-Q7 is in high resistance state When this pin is in low level, Q0-Q7 is in output mode
ST_CP	12	Parallel Update Output: when its electrical level is rising, it will update the parallel data output.
SH_CP	11	Serial shift clock: when its electrical level is rising, serial data input register will do a shift.
MR	10	Remove shift register: When this pin is in low level, the content in shift register will be cleared.
Q7'	9	Serial data output: it can be connected to more 74HC595 in series.

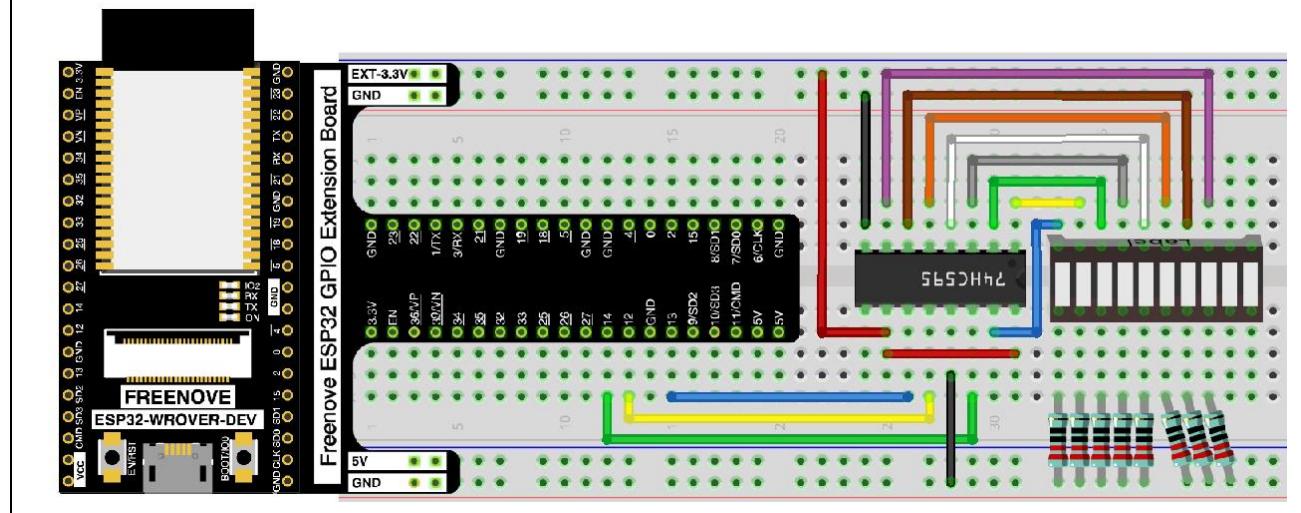

For more detail, please refer to the datasheet on the 74HC595 chip.

The following is the program code:

```

1 int latchPin = 12;           // Pin connected to ST_CP of 74HC595(Pin12)
2 int clockPin = 13;          // Pin connected to SH_CP of 74HC595(Pin11)
3 int dataPin = 14;           // Pin connected to DS of 74HC595(Pin14)
4
5 void setup() {
6   // set pins to output
7   pinMode(latchPin, OUTPUT);
8   pinMode(clockPin, OUTPUT);
9   pinMode(dataPin, OUTPUT);
10 }
11
12 void loop() {

```

Any concerns? ✉ support@freenove.com

```

13 // Define a one-byte variable to use the 8 bits to represent the state of 8 LEDs of LED bar
14 graph.
15 // This variable is assigned to 0x01, that is binary 00000001, which indicates only one LED
16 light on.
17 byte x = 0x01;      // 0b 0000 0001
18 for (int j = 0; j < 8; j++) { // Let led light up from right to left
19     writeTo595(LSBFIRST, x);
20     x <= 1; // make the variable move one bit to left once, then the bright LED move one step
21 to the left once.
22     delay(50);
23 }
24 delay(1000);
25 x = 0x80;          //0b 1000 0000
26 for (int j = 0; j < 8; j++) { // Let led light up from left to right
27     writeTo595(LSBFIRST, x);
28     x >= 1;
29     delay(50);
30 }
31 delay(1000);
32 }
33 void writeTo595(int order, byte _data) {
34     // Output low level to latchPin
35     digitalWrite(latchPin, LOW);
36     // Send serial data to 74HC595
37     shiftOut(dataPin, clockPin, order, _data);
38     // Output high level to latchPin, and 74HC595 will update the data to the parallel output
39 port.
40     digitalWrite(latchPin, HIGH);
41 }
```

In the code, we configure three pins to control the 74HC595 chip and define a one-byte variable to control the state of the 8 LEDs (in the LED bar graph Module) through the 8 bits of the variable. The LEDs light ON when the corresponding bit is 1. If the variable is assigned to 0x01, that is 00000001 in binary, there will be only one LED ON.

17	x=0x01;
----	---------

In the loop(), use "for" loop to send x to 74HC595 output pin to control the LED. In "for" loop, x will shift one bit to the LEFT in one cycle, then when data of x is sent to 74HC595, the LED that is turned ON will move one bit to the LEFT once.

18	for (int j = 0; j < 8; j++) { // Let led light up from right to left
19	writeTo595(LSBFIRST, x);
20	x <= 1;
21	delay(50);
22	}

In second "for" loop, the situation is the same. The difference is that x is shift from 0x80 to the RIGHT in order.

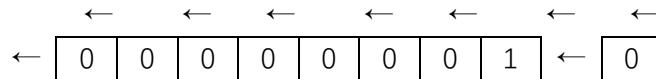

The subfunction writeTo595() is used to write data to 74HC595 and immediately output on the port of 74HC595.

Reference

<< operator

"<<" is the left shift operator, which can make all bits of 1 byte shift by several bits to the left (high) direction and add 0 on the right (low). For example, shift binary 00000001 by 1 bit to left:

byte x = 1 << 1;

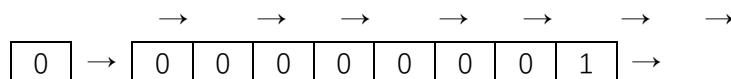

The result of x is 2 (binary 00000010).

There is another similar operator " >> ". For example, shift binary 00000001 by 1 bit to right:

byte x = 1 >> 1;

The result of x is 0 (00000000).

X <<= 1 is equivalent to x = x << 1 and x >>= 1 is equivalent to x = x >> 1

```
void shiftOut(uint8_t dataPin, uint8_t clockPin, uint8_t bitOrder, uint8_t val);
```

This is used to shift an 8-bit data value in with the data appearing on the dataPin and the clock being sent out on the clockPin. Order is as above. The data is sampled after the cPin goes high. (So clockPin high, sample data, clockPin low, repeat for 8 bits) The 8-bit value is returned by the function.

Parameters

dataPin: the pin on which to output each bit. Allowed data types: int.

clockPin: the pin to toggle once the dataPin has been set to the correct value. Allowed data types: int.

bitOrder: which order to shift out the bits; either MSBFIRST or LSBFIRST. (Most Significant Bit First, or, Least Significant Bit First).

value: the data to shift out. Allowed data types: byte.

For more details about shift function, please refer to:

<https://www.arduino.cc/reference/en/language/functions/advanced-io/shifout/>

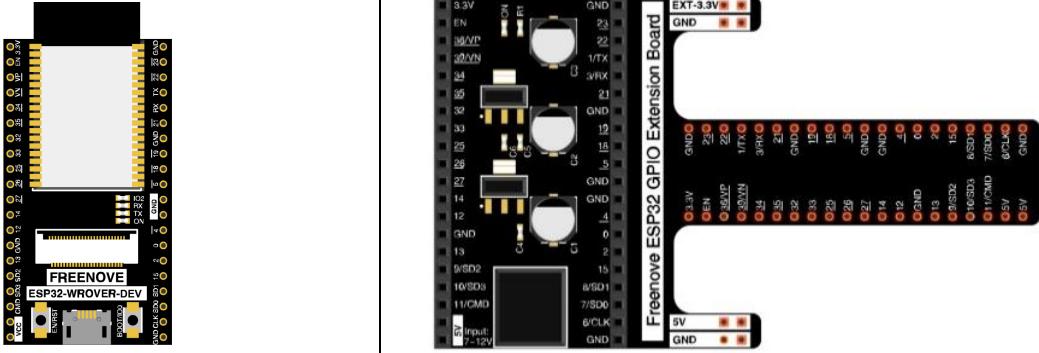

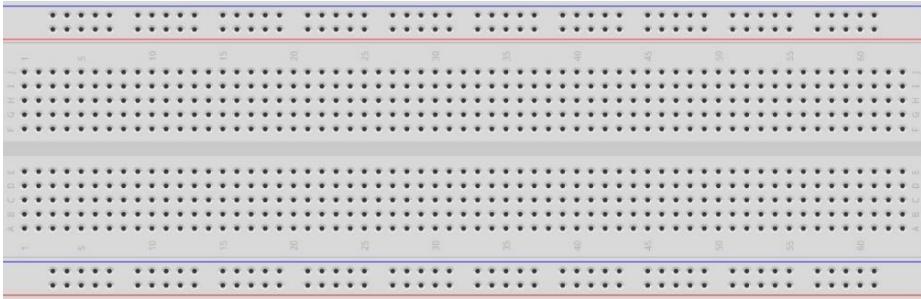

Chapter 15 74HC595 & 7-Segment Display.

In this chapter, we will introduce the 7-Segment Display.

Project 15.1 7-Segment Display.

We will use 74HC595 to control 7-segment display and make it display hexadecimal character "0-F".

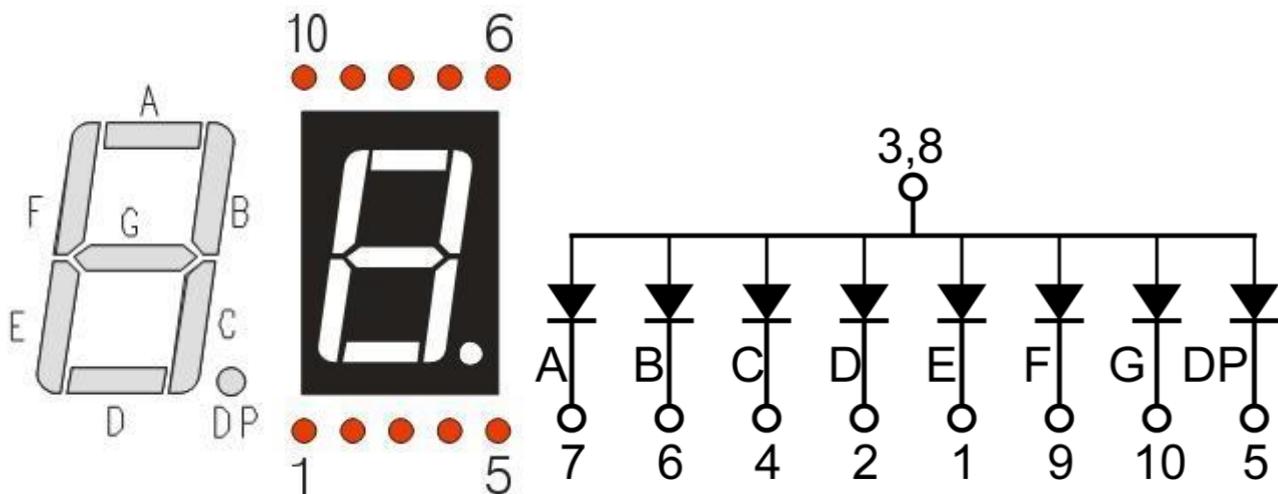

Component List

ESP32-WROVER x1	GPIO Extension Board x1
	
Breadboard x1	
74HC595 x1	7-segment display x1
	
Resistor 220Ω x8	Jumper M/M

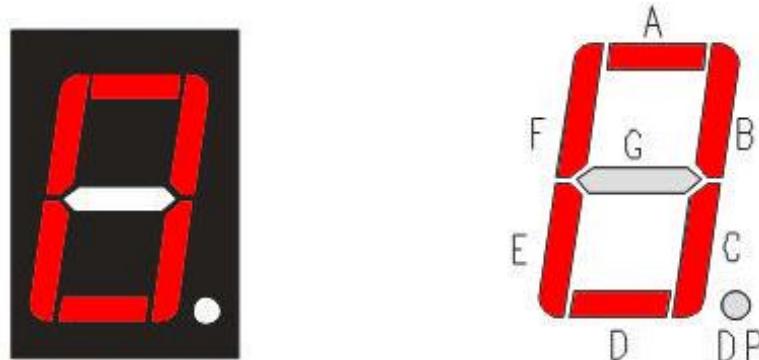

Component knowledge

7-segment display

A 7-segment display is a digital electronic display device. There is a figure "8" and a decimal point represented, which consists of 8 LEDs. The LEDs have a common anode and individual cathodes. Its internal structure and pin designation diagram is shown below:

As we can see in the above circuit diagram, we can control the state of each LED separately. Also, by combining LEDs with different states of ON and OFF, we can display different characters (Numbers and Letters). For example, to display a "0": we need to turn ON LED segments A, B, C, D, E and F, and turn OFF LED segments G and DP.

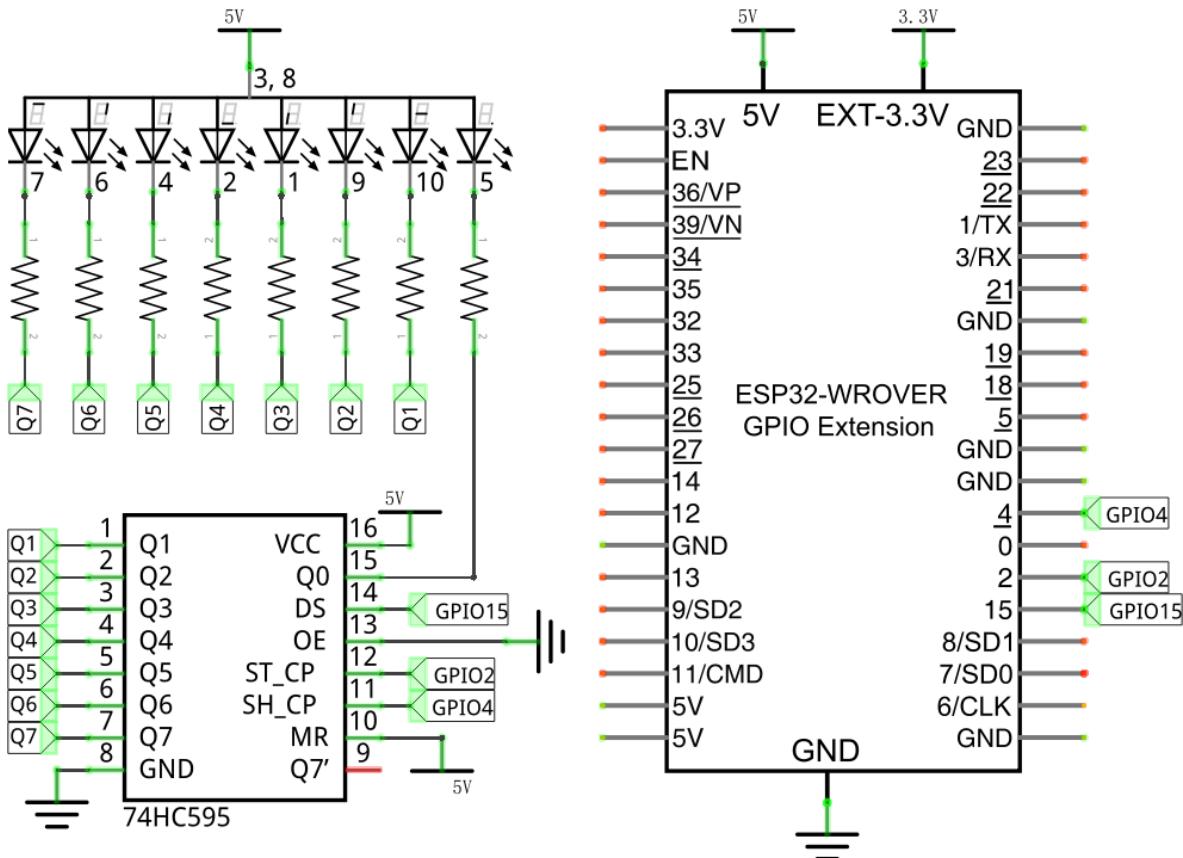

In this project, we will use a 7-Segment Display with a common anode. Therefore, when there is an input low level to a LED segment the LED will turn ON. Defining segment "A" as the lowest level and segment "DP" as the highest level, from high to low would look like this: "DP", "G", "F", "E", "D", "C", "B", "A". Character "0" corresponds to the code: $1100\ 0000_b = 0xc0$.

For detailed code values, please refer to the following table (common anode).

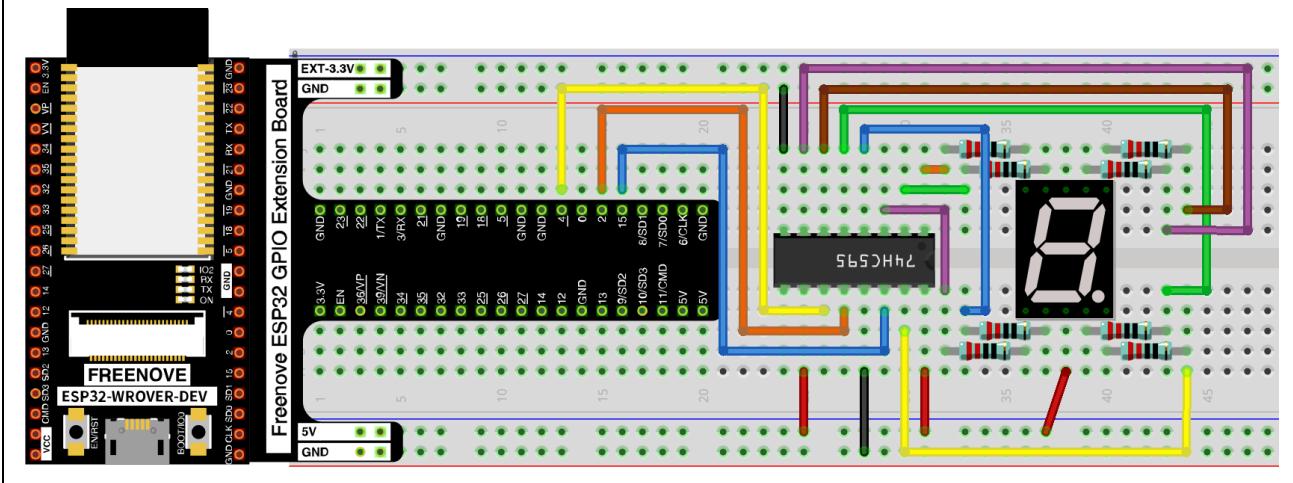

CHAR	DP	G	F	E	D	C	B	A	Hex	ASCII
0	1	1	0	0	0	0	0	0	0xc0	1100 0000
1	1	1	1	1	1	0	0	1	0xf9	1111 1001

14 ESP32 Wrover Module on COM8

Verify and upload the code, and you'll see a 1-bit, 7-segment display displaying 0-f in a loop.

The following is the program code:

```

1 int dataPin = 15;           // Pin connected to DS of 74HC595 (Pin14)
2 int latchPin = 2;          // Pin connected to ST_CP of 74HC595 (Pin12)
3 int clockPin = 4;          // Pin connected to SH_CP of 74HC595 (Pin11)
4 // Define the encoding of characters 0-F for the common-anode 7-Segment Display
5 byte num[] = {
6     0xc0, 0xf9, 0xa4, 0xb0, 0x99, 0x92, 0x82, 0xf8,
7     0x80, 0x90, 0x88, 0x83, 0xc6, 0xa1, 0x86, 0x8e
8 };
9
10 void setup() {
11     // set pins to output
12     pinMode(latchPin, OUTPUT);
13     pinMode(clockPin, OUTPUT);
14     pinMode(dataPin, OUTPUT);
15 }
16
17 void loop() {
18     // display 0-F on digital tube
19     for (int i = 0; i < 16; i++) {
20         writeData(num[i]); // Send data to 74HC595
21         delay(1000);      // delay 1 second
22         writeData(0xff); // Clear the display content
23     }
24 }
25
26 void writeData(int value) {
27     // Make latchPin output low level
28     digitalWrite(latchPin, LOW);
29     // Send serial data to 74HC595
30     shiftOut(dataPin, clockPin, LSBFIRST, value);
31     // Make latchPin output high level
32     digitalWrite(latchPin, HIGH);
33 }
```

First, put encoding of “0”- “F” into the array.

```

4 // Define the encoding of characters 0-F for the common-anode 7-Segment Display
5 byte num[] = {
6     0xc0, 0xf9, 0xa4, 0xb0, 0x99, 0x92, 0x82, 0xf8,
7     0x80, 0x90, 0x88, 0x83, 0xc6, 0xa1, 0x86, 0x8e
8 };

```

Then, in the loop, we transfer the member of the “num” to 74HC595 by calling the writeData function, so that the digital tube displays what we want. After each display, “0xff” is used to eliminate the previous effect and prepare for the next display.

```

17 void loop() {
18     // display 0-F on digital tube
19     for (int i = 0; i < 16; i++) {
20         writeData(num[i]); // Send data to 74HC595
21         delay(1000);      // delay 1 second
22         writeData(0xff); // Clear the display content
23     }
24 }

```

In the shiftOut() function, whether to use LSBFIRST or MSBFIRST as the parameter depends on the physical situation.

```

26 void writeData(int value) {
27     // Make latchPin output low level
28     digitalWrite(latchPin, LOW);
29     // Send serial data to 74HC595
30     shiftOut(dataPin, clockPin, LSBFIRST, value);
31     // Make latchPin output high level, then 74HC595 will update data to parallel output
32     digitalWrite(latchPin, HIGH);
33 }

```

If you want to display the decimal point, make the highest bit of each array become 0, which can be implemented easily by num[i]&0x7f.

```
30 shiftOut(dataPin, clockPin, LSBFIRST, value & 0x7f);
```

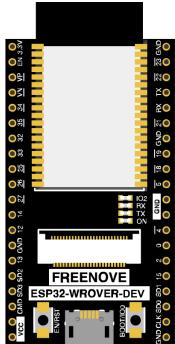

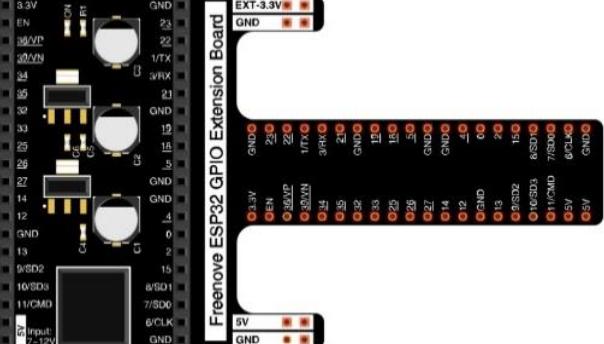

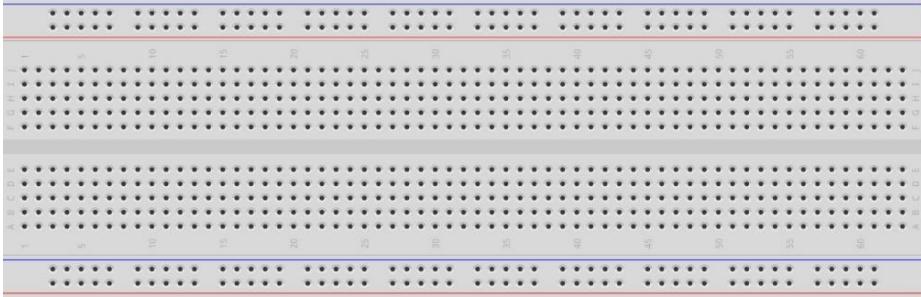

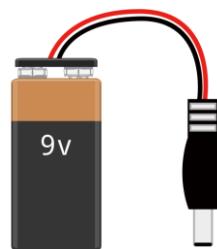

Chapter 16 Relay & Motor

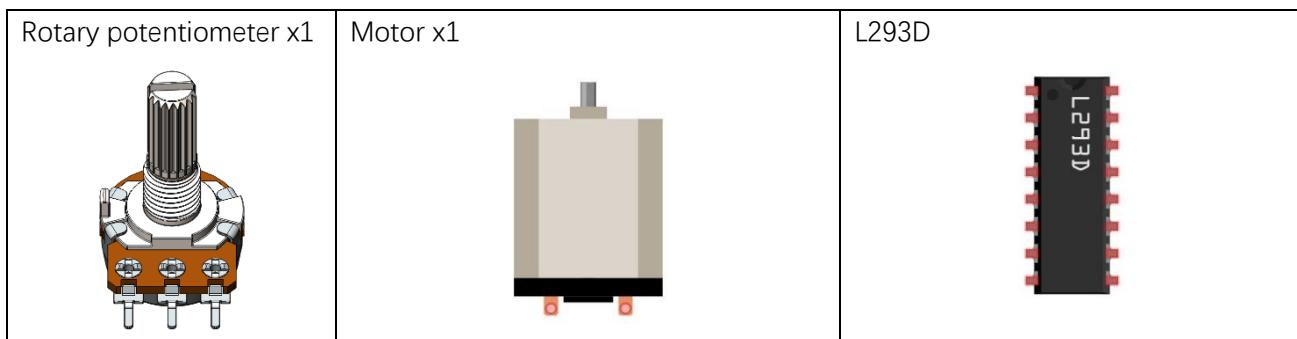

In this chapter, we will learn a kind of special switch module, relay module.

Project 16.1 Control Motor with Potentiometer

Control the direction and speed of the motor with a potentiometer.

Breadboard x1			
Jumper M/M			
			

Component knowledge

L293D

L293D is an IC chip (Integrated Circuit Chip) with a 4-channel motor drive. You can drive a unidirectional DC motor with 4 ports or a bi-directional DC motor with 2 ports or a stepper motor (stepper motors are covered later in this Tutorial).

Port description of L293D module is as follows:

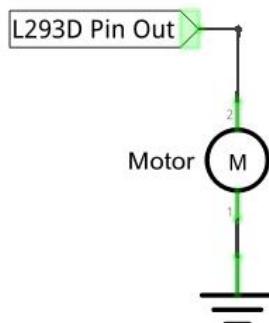

Pin name	Pin number	Description
In x	2, 7, 10, 15	Channel x digital signal input pin
Out x	3, 6, 11, 14	Channel x output pin, input high or low level according to In x pin, get connected to +Vmotor or 0V
Enable1	1	Channel 1 and channel 2 enable pin, high level enable
Enable2	9	Channel 3 and channel 4 enable pin, high level enable
0V	4, 5, 12, 13	Power cathode (GND)
+V	16	Positive electrode (VCC) of power supply, supply voltage 3.0~36V
+Vmotor	8	Positive electrode of load power supply, provide power supply for the Out pin x, the supply voltage is +V~36V

For more detail, please refer to the datasheet for this IC Chip.

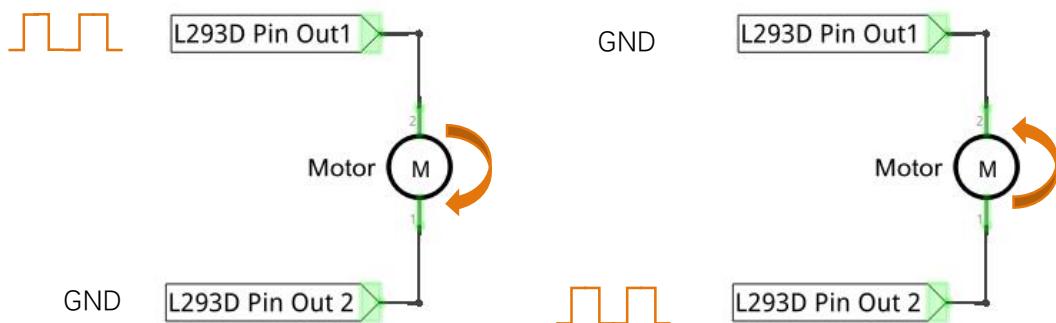

When using L293D to drive DC motor, there are usually two connection options.

The following connection option uses one channel of the L293D, which can control motor speed through the PWM, However the motor then can only rotate in one direction.

The following connection uses two channels of the L293D: one channel outputs the PWM wave, and the other channel connects to GND, therefore you can control the speed of the motor. When these two channel signals are exchanged, not only controls the speed of motor, but also can control the steering of the motor.

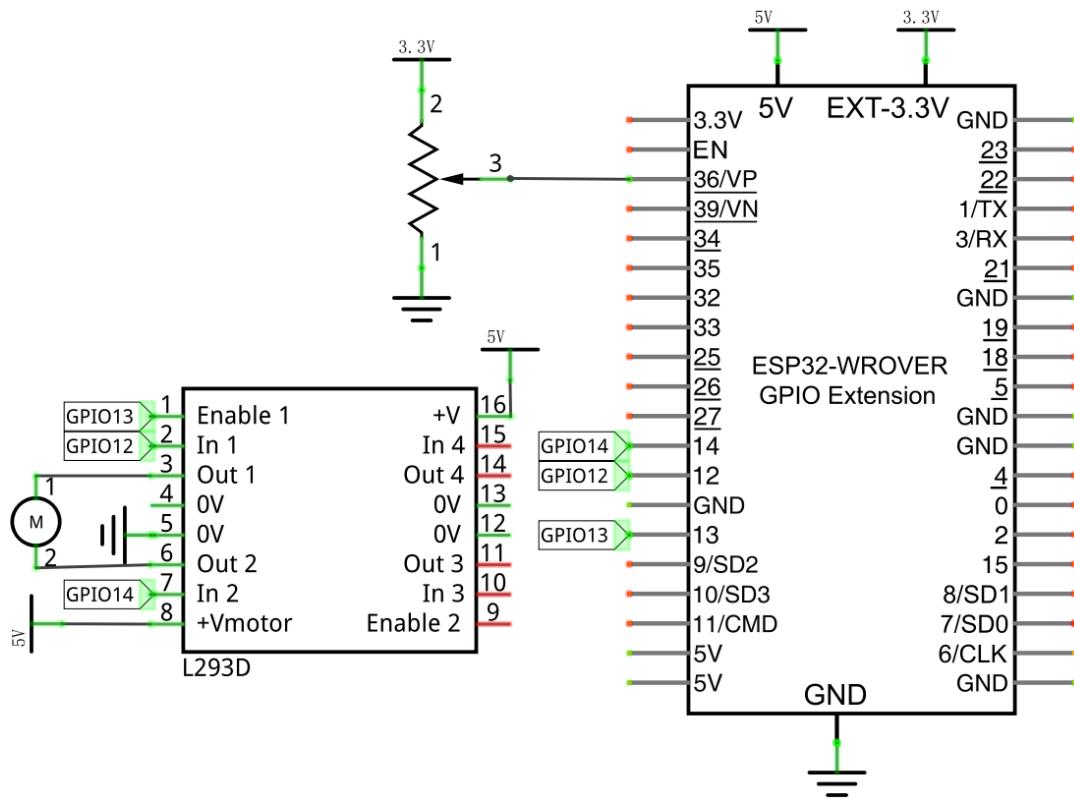

In practical use the motor is usually connected to channel 1 and 2 by outputting different levels to in1 and in2 to control the rotational direction of the motor, and output to the PWM wave to Enable1 port to control the motor's rotational speed. If the motor is connected to channel 3 and 4 by outputting different levels to in3 and in4 to control the motor's rotation direction, and output to the PWM wave to Enable2 pin to control the motor's rotational speed.

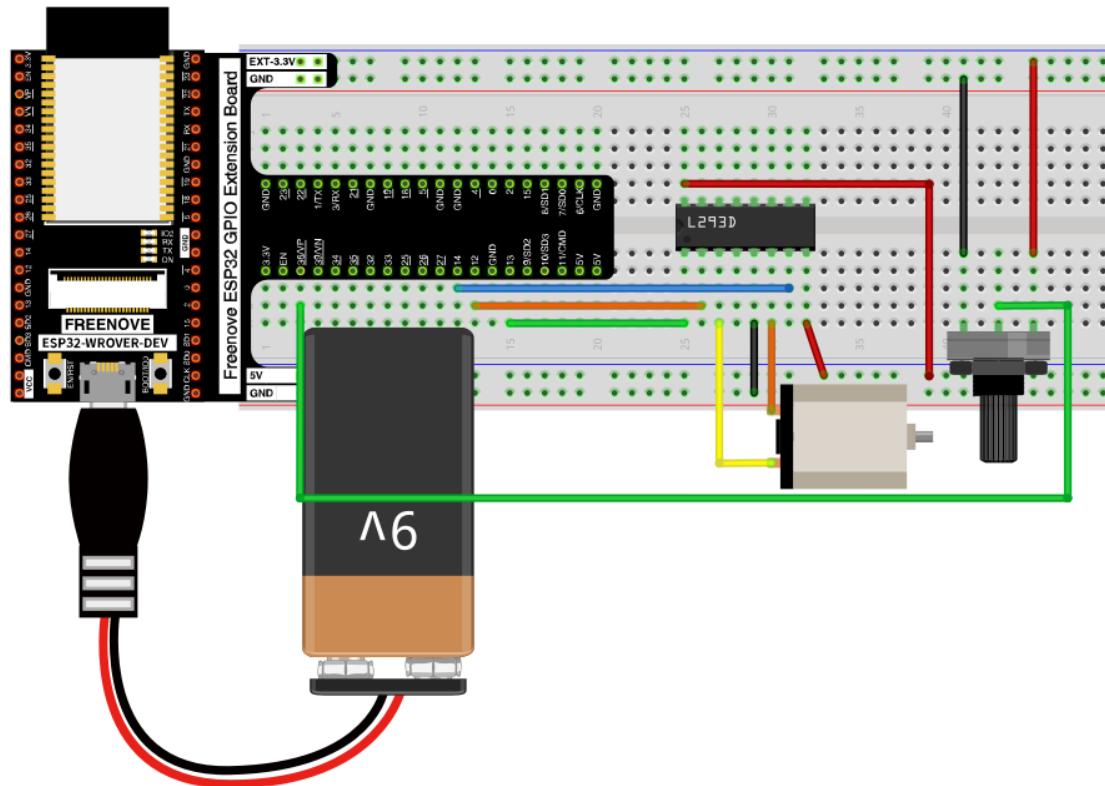

Circuit

Use caution when connecting this circuit, because the DC motor is a high-power component, do not use the power provided by the ESP32 to power the motor directly, which may cause permanent damage to your ESP32! The logic circuit can be powered by the ESP32 power or an external power supply, which should share a common ground with ESP32.

Schematic diagram

Hardware connection. If you need any support, please feel free to contact us via: support@freenove.com

Note: the motor circuit uses A large current, about 0.2-0.3A without load. We recommend that you use a 9V battery to power the extension board.

Hard resetting via RTS pin...

1 ESP32 Wrover Module on COM6

Download code to ESP32-WROVER, rotate the potentiometer in one direction and the motor speeds up slowly in one direction. And then rotate the potentiometer in the other direction and the motor will slow down to stop. And then rotate it in an inverse direction to accelerate the motor.

The following is the sketch:

```

1 int in1Pin = 12;      // Define L293D channel 1 pin
2 int in2Pin = 14;      // Define L293D channel 2 pin
3 int enable1Pin = 13; // Define L293D enable 1 pin
4 int channel = 0;
5
6 boolean rotationDir; // Define a variable to save the motor's rotation direction
7 int rotationSpeed;   // Define a variable to save the motor rotation speed
8
9 void setup() {
10    // Initialize the pin into an output mode:
11    pinMode(in1Pin, OUTPUT);
12    pinMode(in2Pin, OUTPUT);
13    pinMode(enable1Pin, OUTPUT);
14
15    ledcSetup(channel, 1000, 11); //Set PWM to 11 bits, range is 0-2047
16    ledcAttachPin(enable1Pin, channel);
17 }
18
19 void loop() {
20    int potenVal = analogRead(A0); // Convert the voltage of rotary potentiometer into digital
21    rotationSpeed = potenVal - 2048;
22    if (potenVal > 2048)
23        rotationDir = true;
24    else
25        rotationDir = false;
26    // Calculate the motor speed
27    rotationSpeed = abs(potenVal - 2048);
28    //Control the steering and speed of the motor
29    driveMotor(rotationDir, constrain(rotationSpeed, 0, 2048));
30 }
31
32 void driveMotor(boolean dir, int spd) {
33    if (dir) { // Control motor rotation direction
34        digitalWrite(in1Pin, HIGH);
35        digitalWrite(in2Pin, LOW);
36    }
37    else {
38        digitalWrite(in1Pin, LOW);
39        digitalWrite(in2Pin, HIGH);
40    }
41    ledcWrite(channel, spd); // Control motor rotation speed
42 }
```

The ADC of ESP32 has a 12-bit accuracy, corresponding to a range from 0 to 4095. In this program, set the

Any concerns? ✉ support@freenove.com

number 2048 as the midpoint. If the value of ADC is less than 2048, make the motor rotate in one direction. If the value of ADC is greater than 2048, make the motor rotate in the other direction. Subtract 2048 from the ADC value and take the absolute value and use this result as the speed of the motor.

```
20 int potenVal = analogRead(A0); // Convert the voltage of rotary potentiometer into digital
21 rotationSpeed = potenVal - 2048;
22 if (potenVal > 2048)
23     rotationDir = true;
24 else
25     rotationDir = false;
26 // Calculate the motor speed
27 rotationSpeed = abs(potenVal - 2048);
28 //Control the steering and speed of the motor
29 driveMotor(rotationDir, constrain(rotationSpeed, 0, 2048));
30 }
```

Set the accuracy of the PWM to 11 bits and range from 0 to 2047 to control the rotation speed of the motor.

```
15 ledcSetup(channel, 1000, 11); //Set PWM to 11 bits, range is 0-2047
```

Function `driveMotor` is used to control the rotation direction and speed of the motor. The `dir` represents direction while `spd` refers to speed.

```
34 void driveMotor(boolean dir, int spd) {
35     // Control motor rotation direction
36     if (rotationDir) {
37         digitalWrite(in1Pin, HIGH);
38         digitalWrite(in2Pin, LOW);
39     }
40     else {
41         digitalWrite(in1Pin, LOW);
42         digitalWrite(in2Pin, HIGH);
43     }
44     // Control motor rotation speed
45     ledcWrite(channel, spd);
46 }
```

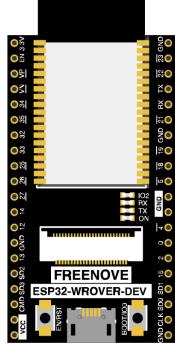

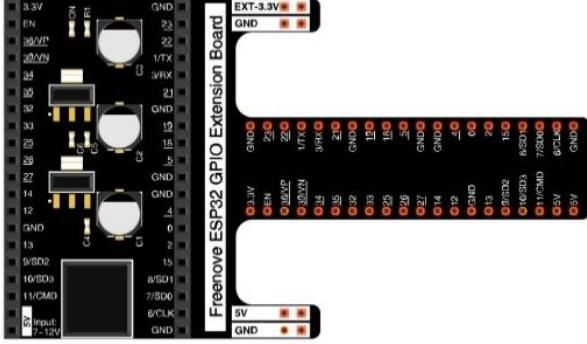

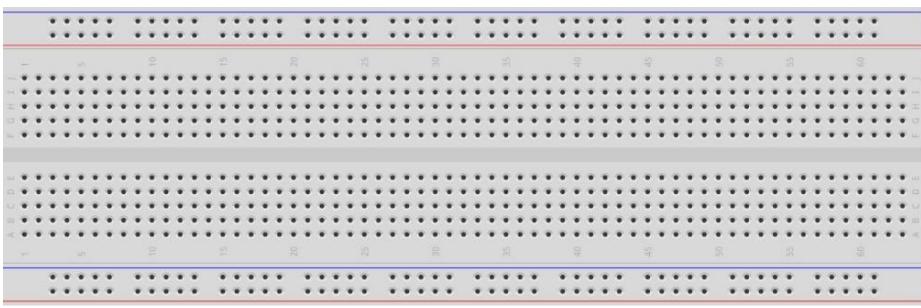

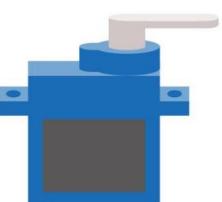

Chapter 17 Servo

Previously, we learned how to control the speed and rotational direction of a motor. In this chapter, we will learn about servos which are a rotary actuator type motor that can be controlled to rotate to specific angles.

Project 17.1 Servo Sweep

First, we need to learn how to make a servo rotate.

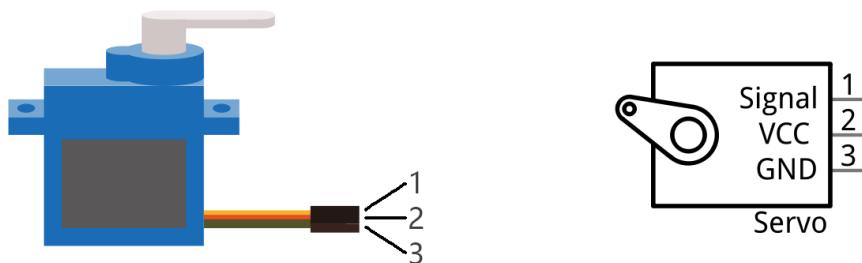

Component List

ESP32-WROVER x1	GPIO Extension Board x1
	
Breadboard x1	
Servo x1	Jumper M/M x3
	

Component knowledge

Servo

Servo is a compact package which consists of a DC motor, a set of reduction gears to provide torque, a sensor and control circuit board. Most servos only have a 180-degree range of motion via their "horn". Servos can output higher torque than a simple DC motor alone and they are widely used to control motion in model cars, model airplanes, robots, etc. Servos have three wire leads which usually terminate to a male or female 3-pin plug. Two leads are for electric power: positive (2-VCC, Red wire), negative (3-GND, Brown wire), and the signal line (1-Signal, Orange wire), as represented in the Servo provided in your Kit.

We will use a 50Hz PWM signal with a duty cycle in a certain range to drive the Servo. The lasting time of 0.5ms-2.5ms of PWM single cycle high level corresponds to the servo angle 0 degrees - 180 degree linearly. Part of the corresponding values are as follows:

High level time	Servo angle
0.5ms	0 degree
1ms	45 degree
1.5ms	0 degree
2ms	45 degree
2.5ms	180 degree

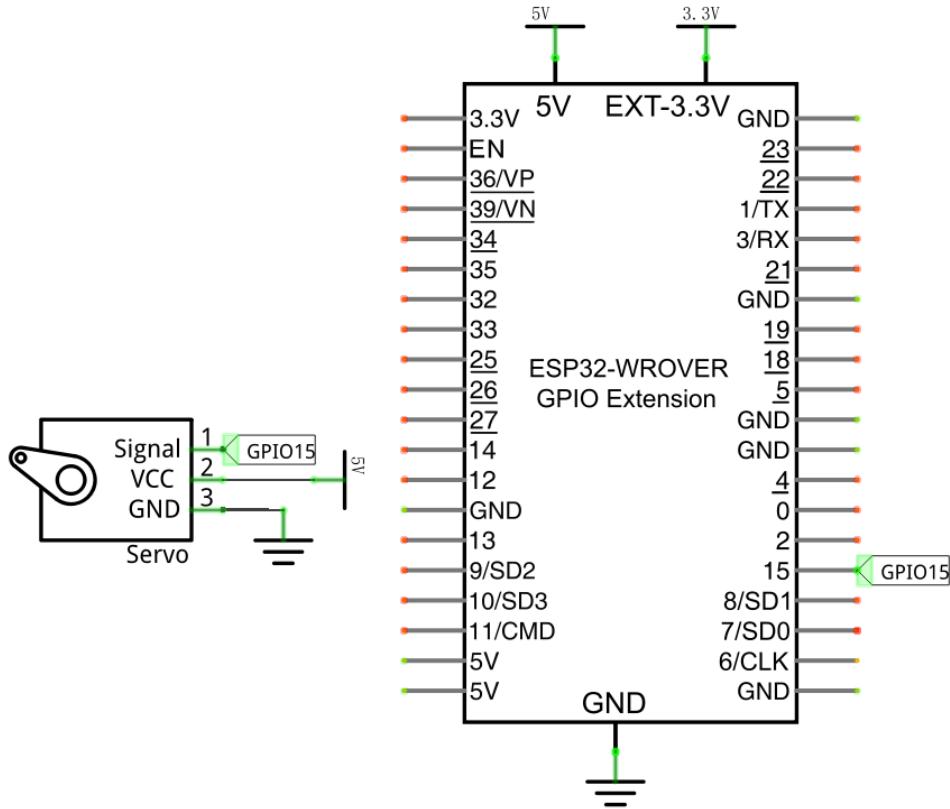

When you change the servo signal value, the servo will rotate to the designated angle.

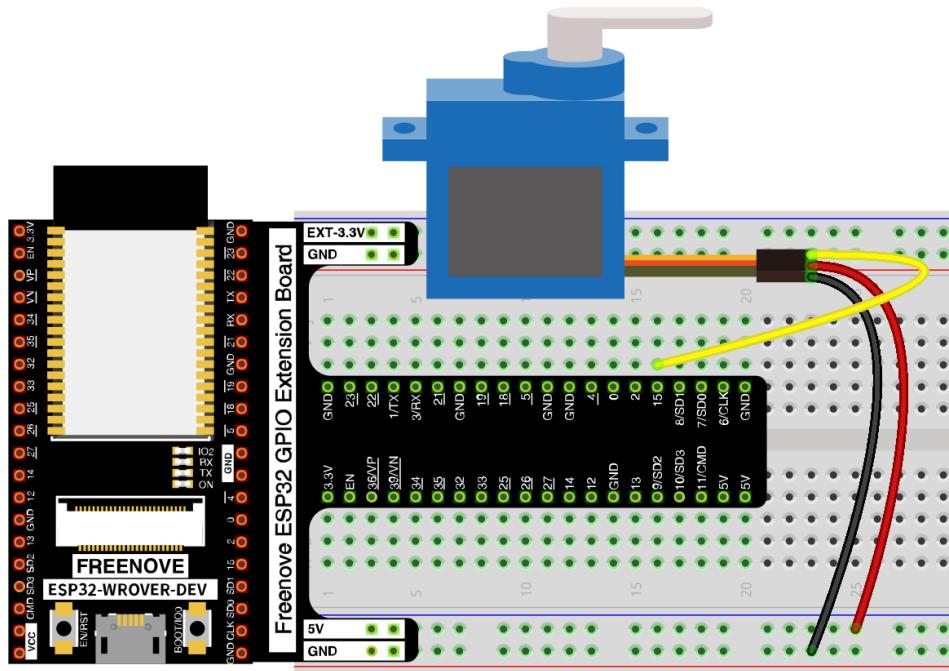

Circuit

Use caution when supplying power to the servo, it should be 5V. Make sure you do not make any errors when connecting the servo to the power supply.

28   }
29 }

```

Done uploading.

Leaving...
Hard resetting via RTS pin...

Compile and upload the code to ESP32-WROVER, the servo will rotate from 0 degrees to 180 degrees and then reverse the direction to make it rotate from 180 degrees to 0 degrees and repeat these actions in an endless loop.

The following is the program code:

```

1 #include <ESP32Servo.h>
2
3 Servo myservo; // create servo object to control a servo
4 int posVal = 0; // variable to store the servo position
5 int servoPin = 15; // Servo motor pin
6 void setup() {
7     myservo.setPeriodHertz(50); // standard 50 hz servo
8     myservo.attach(servoPin, 500, 2500); // attaches the servo on servoPin to the servo
9     object
10 }
11 void loop() {
12     for (posVal = 0; posVal <= 180; posVal += 1) { // goes from 0 degrees to 180 degrees
13         // in steps of 1 degree
14         myservo.write(posVal); // tell servo to go to position in variable 'pos'
15         delay(15); // waits 15ms for the servo to reach the position
16     }
17     for (posVal = 180; posVal >= 0; posVal -= 1) { // goes from 180 degrees to 0 degrees
18         myservo.write(posVal); // tell servo to go to position in variable 'pos'
19         delay(15); // waits 15ms for the servo to reach the position
20     }
}

```

Servo uses the ESP32Servo library, like the following reference to ESP32Servo library:

```
1 #include <ESP32Servo.h>
```

ESP32Servo library provides the ESP32Servo class that controls it. ESP32Servo class must be instantiated before using:

```
3 Servo myservo; // create servo object to control a servo
```

Set the control servo motor pin, the time range of high level.

```
8 myservo.attach(servoPin,500,2500);
```

After initializing the servo, you can control the servo to rotate to a specific angle:

```
17 myservo.write(posVal);
```

Reference

```
class Servo
```

Servo class must be instantiated when used, that is, define an object of Servo type, for example:

```
Servo myservo;
```

The function commonly used in the servo class is as follows:

setPeriodHertz(data): Set the frequency of the servo motor.

attach(pin,low,high): Initialize the servo,

pin: the port connected to servo signal line.

low: set the time of high level corresponding to 0 degree.

high: set the time of high level corresponding to 180 degrees.

write(angle): Control servo to rotate to the specified angle.

Project 17.2 Servo Knop

Use a potentiometer to control the servo motor to rotate at any angle.

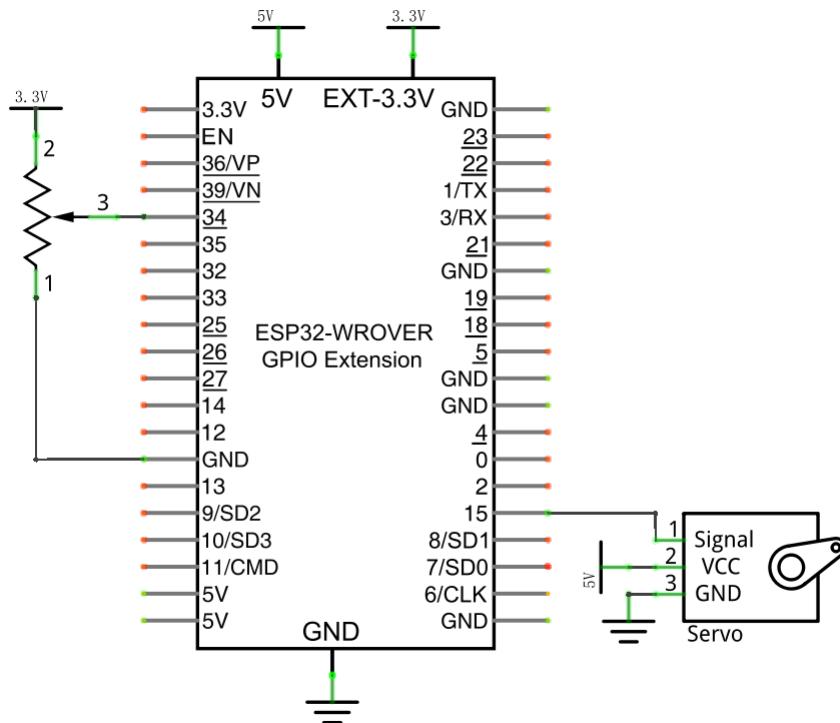

Component List

ESP32-WROVER x1	GPIO Extension Board x1	
A black ESP32 development board with a white central component labeled "FREENOVE ESP32-WROVER-DEV". It has a 40-pin header and various pins labeled with letters and numbers.	A black extension board with two 2x10 pin headers. It has several pins labeled with letters and numbers, and some components like resistors and capacitors.	
Breadboard x1	A diagram of a breadboard with 8 columns and 40 rows of holes. Columns are labeled A through H at the top and 1 through 40 along the bottom. Power rails are shown at the top and bottom.	
Servo x1	Jumper M/M x6	Rotary potentiometer x1
A blue servo motor with a black plastic housing and a silver metal gear.	A green jumper wire with two black plastic caps.	A brown rotary potentiometer with a silver shaft and three terminals.

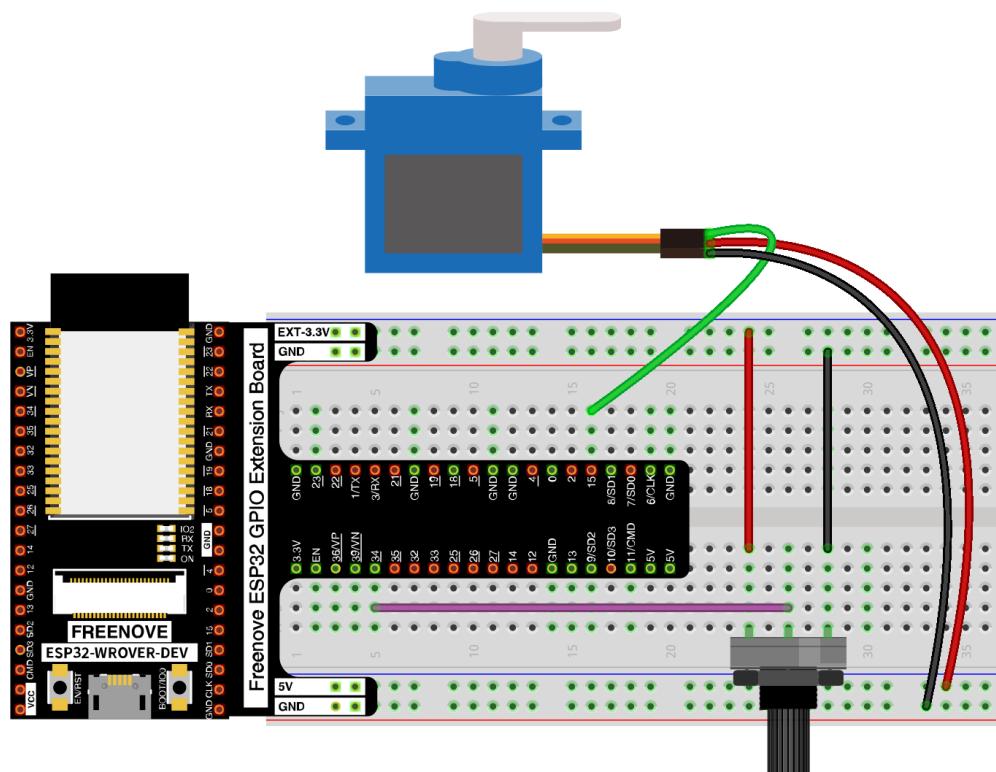

Circuit

Use caution when supplying power to the servo, it should be 5V. Make sure you do not make any errors when connecting the servo to the power supply.

10 Servo myservo; // create servo object to control a servo
11
12 int servoPin = 15;      // GPIO pin used to connect the servo control (digital out)
13 int potPin = 34;        // GPIO pin used to connect the potentiometer (analog in)
14 int potVal;            //variable to read the value from the analog pin
15
16 void setup()
17 {
18     myservo.setPeriodHertz(50); // Standard 50hz servo
19     // attaches the servo on servoPin to the servo object
20     myservo.attach(servoPin, 500, 2500);
21     Serial.begin(115200);
22 }
23
24 void loop() {
25     // read the value of the potentiometer (value between 0 and 4095)
26     potVal = analogRead(potPin);
27     Serial.printf("potVal_1: %d\t",potVal);
28     // scale it to use it with the servo (value between 0 and 180)
29     potVal = map(potVal, 0, ADC_Max, 0, 180);
30     // set the servo position according to the scaled value
31     myservo.write(potVal);
32     Serial.printf("potVal_2: %d\n",potVal);
33     delay(15); // wait for the servo to get there
34 }
```

Done uploading.
Leaving...
Hard resetting via RTS pin...

Compile and upload the code to ESP32-WROVER, twist the potentiometer back and forth, and the servo motor rotates accordingly.

The following is the program code:

```

1 #include <ESP32Servo.h>
2 #define ADC_Max 4095 // This is the default ADC max value on the ESP32 (12 bits ADC width);
3
4 Servo myservo; // create servo object to control a servo
5
6 int servoPin = 15; // GPIO pin used to connect the servo control (digital out)
7 int potPin = 34; // GPIO pin used to connect the potentiometer (analog in)
8 int potVal; //variable to read the value from the analog pin
9
10 void setup()
11 {
12     myservo.setPeriodHertz(50); // Standard 50hz servo
13     myservo.attach(servoPin, 500, 2500); // attaches the servo on servoPin to the servo object
14     Serial.begin(115200);
15 }
16
17 void loop() {
18     potVal = analogRead(potPin); // read the value of the potentiometer (value
19     // between 0 and 1023)
20     Serial.printf("potVal_1: %d\t", potVal);
21     potVal = map(potVal, 0, ADC_Max, 0, 180); // scale it to use it with the servo (value between
22     // 0 and 180)
23     myservo.write(potVal); // set the servo position according to the scaled
24     // value
25     Serial.printf("potVal_2: %d\n", potVal);
26     delay(15); // wait for the servo to get there
27 }
```

In this experiment, we obtain the ADC value of the potentiometer and store it in potVal. Use map function to convert it into corresponding angle value and we can control the motor to rotate to a specified angle, and print the value via serial.

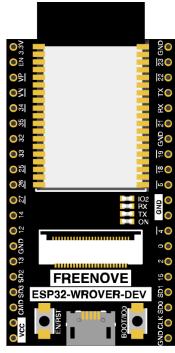

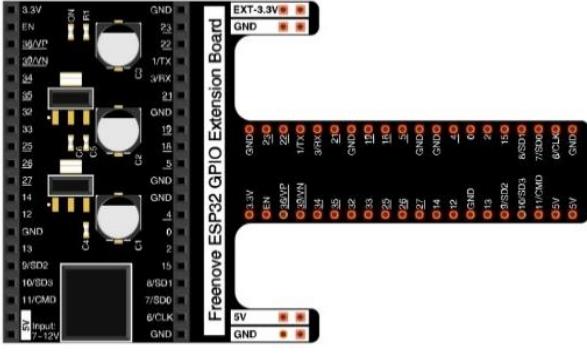

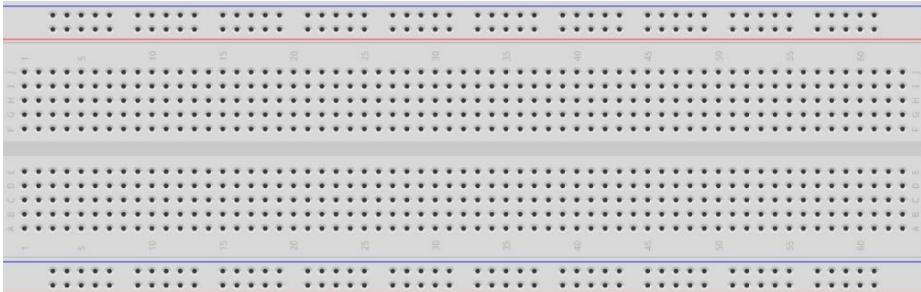

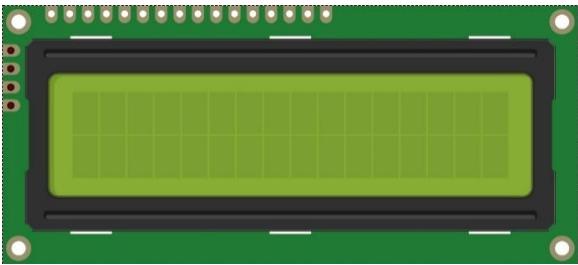

Chapter 18 LCD1602

In this chapter, we will learn about the LCD1602 Display Screen

Project 18.1 LCD1602

In this section we learn how to use LCD1602 to display something.

ESP32-WROVER x1	GPIO Extension Board x1
 	
Breadboard x1	
LCD1602 Module x1	Jumper F/M x4
	

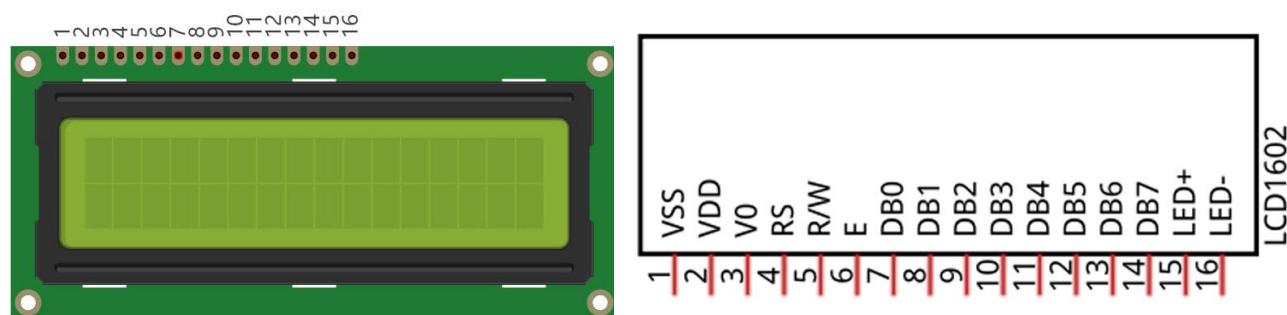

Component knowledge

I2C communication

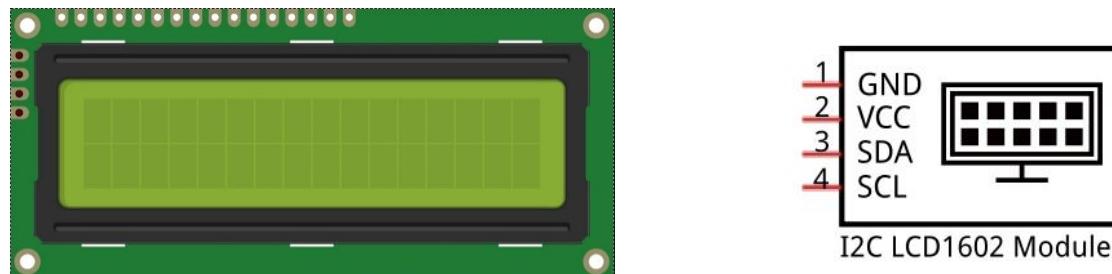

I2C (Inter-Integrated Circuit) is a two-wire serial communication mode, which can be used for the connection of micro controllers and their peripheral equipment. Devices using I2C communication must be connected to the serial data (SDA) line, and serial clock (SCL) line (called I2C bus). Each device has a unique address and can be used as a transmitter or receiver to communicate with devices connected to the bus.

LCD1602 communication

The LCD1602 display screen can display 2 lines of characters in 16 columns. It is capable of displaying numbers, letters, symbols, ASCII code and so on. As shown below is a monochrome LCD1602 display screen along with its circuit pin diagram

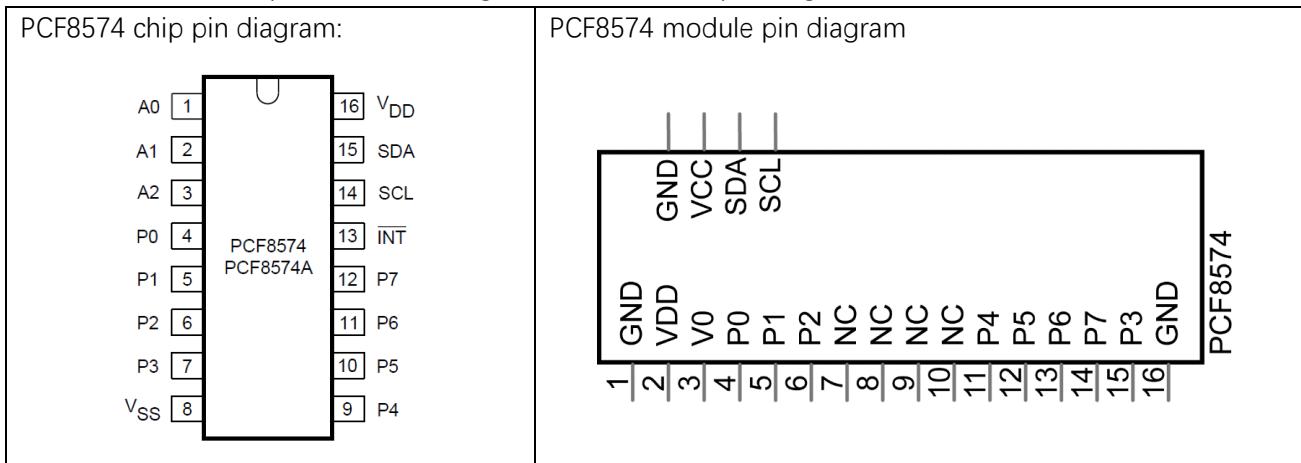

I2C LCD1602 display screen integrates a I2C interface, which connects the serial-input & parallel-output module to the LCD1602 display screen. This allows us to only use 4 lines to operate the LCD1602.

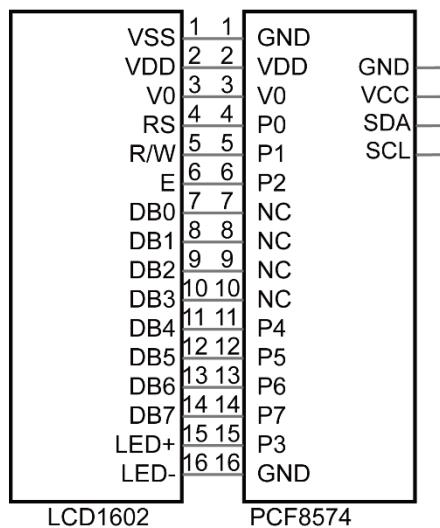

The serial-to-parallel IC chip used in this module is PCF8574T (PCF8574AT), and its default I2C address is 0x27(0x3F).

Below is the PCF8574 pin schematic diagram and the block pin diagram:

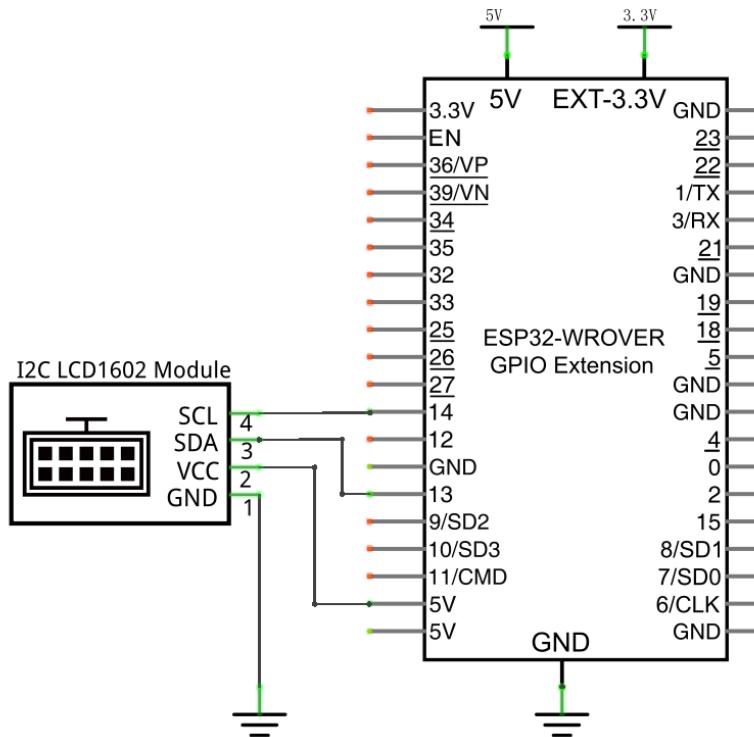

PCF8574 module pin and LCD1602 pin are corresponding to each other and connected with each other:

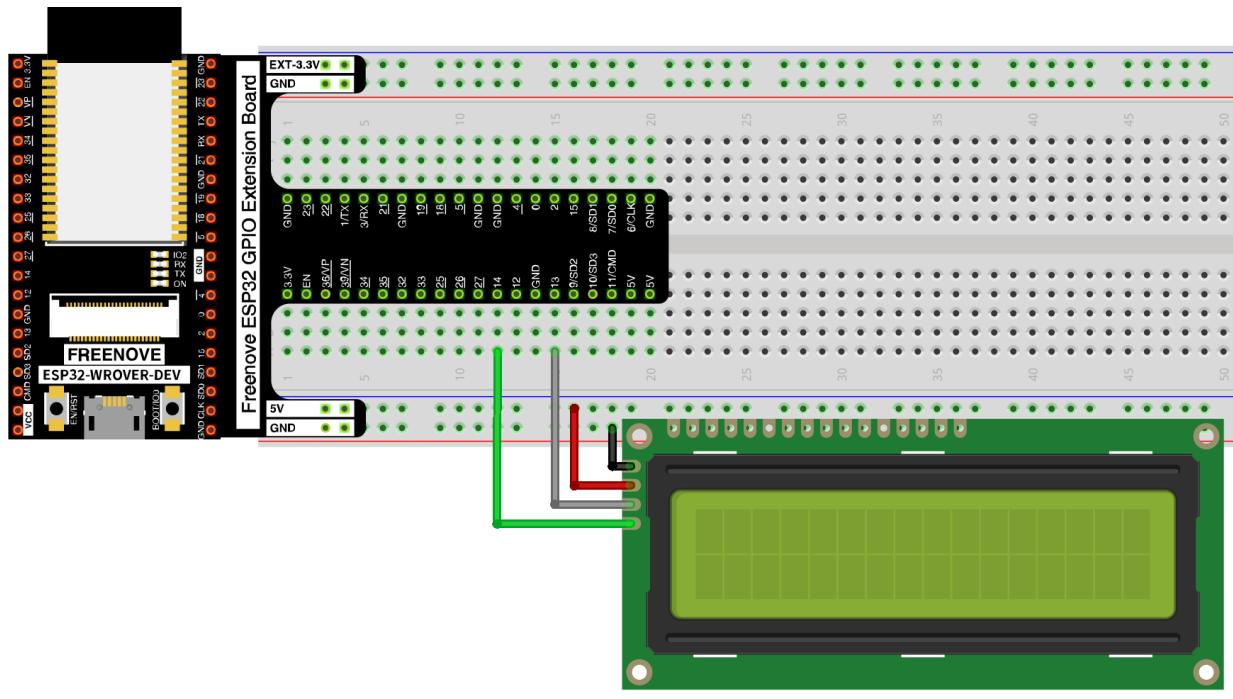

So we only need 4 pins to control the 16 pins of the LCD1602 display screen through the I₂C interface. In this project, we will use the I₂C LCD1602 to display some static characters and dynamic variables.

14     Wire.begin(SDA, SCL);          // attach the IIC pin
15     lcd.init();                   // LCD driver initialization
16     lcd.backlight();              // Turn on the backlight
17     lcd.setCursor(0, 0);          // Move the cursor to row 0, column 0
18     lcd.print("hello, world! ");
19 }
20
21 void loop() {
22     lcd.setCursor(0, 1);          // Move the cursor to row 1, column 0
23     lcd.print("Counter:");
24     lcd.print(millis() / 1000);
25     delay(1000);
26 }
```

Include header file of Liquid Crystal Display (LCD)1602 and I2C.

```
1 #include <LiquidCrystal_I2C.h>
2 #include <Wire.h>
```

Instantiate the I2C LCD1602 screen. It should be noted here that if your LCD driver chip uses PCF8574T, set the I2C address to 0x27, and if uses PCF8574AT, set the I2C address to 0x3F.

```
11 LiquidCrystal_I2C lcd(0x27, 16, 2);
```

Initialize I2C and set its pins as 13,14. And then initialize LCD1602 and turn on the backlight of LCD.

```
14 Wire.begin(SDA, SCL);           // attach the IIC pin
15 lcd.init();                   // LCD driver initialization
16 lcd.backlight();              // Turn on the backlight
```

Move the cursor to the first row, first column, and then display the character.

```
17 lcd.setCursor(0, 0);          // Move the cursor to row 0, column 0
18 lcd.print("hello, world!");    // The print content is displayed on the LCD
```

Print the number on the second line of LCD1602.

```
12 void loop() {
13     //set the cursor to column 0, line 1
14     //(note:parameter "0" is the first columns,
15     //parameter "1" is the second row, since counting begins with 0)
16     lcd.setCursor(0, 1); //0 stand for column, 1 stand for row
17     // print the number of seconds since reset:
18     lcd.print("Counter:");
19     lcd.print(millis() / 1000);
20 }
```

Reference

class LiquidCrystal

The LiquidCrystal class can manipulate common LCD screens. The first step is defining an object of LiquidCrystal, for example:

```
LiquidCrystal_I2C lcd(0x27, 16, 2);
```

Instantiate the Lcd1602 and set the I2C address to 0x27, with 16 columns per row and 2 rows per column.

```
init();
```

Initializes the Lcd1602's device

```
backlight();
```

Turn on Lcd1602's backlight.

```
setCursor(column, row);
```

Sets the screen's column and row.

column: The range is 0 to 15.

row: The range is 0 to 1.

```
print(String);
```

Print the character string on Lcd1602

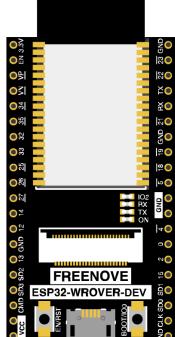

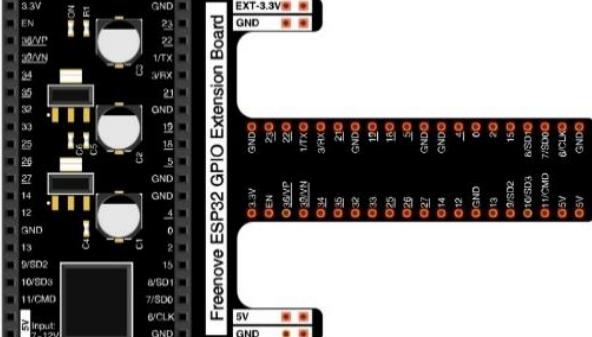

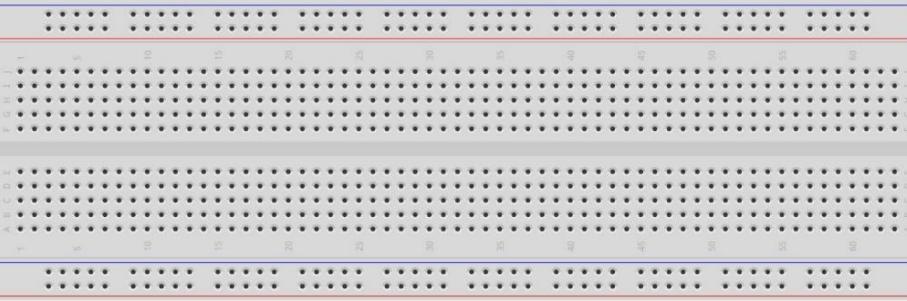

Chapter 19 Ultrasonic Ranging

In this chapter, we learn a module which use ultrasonic to measure distance, HC SR04.

Project 19.1 Ultrasonic Ranging

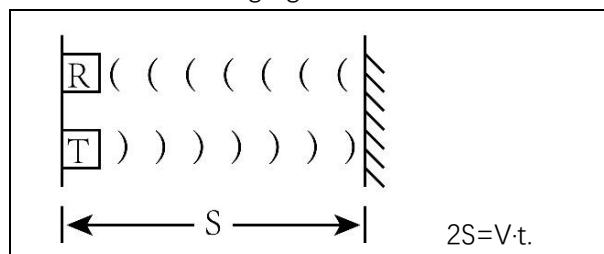

In this project, we use ultrasonic ranging module to measure distance, and print out the data in the terminal.

Component List

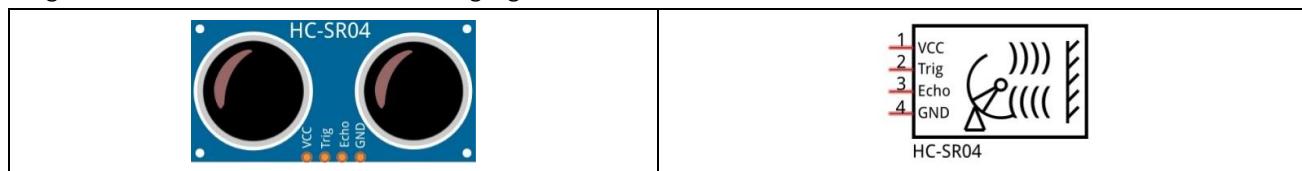

ESP32-WROVER x1	GPIO Extension Board x1
	
Breadboard x1	
Jumper F/M x4	HC SR04 x1
	

Component Knowledge

The ultrasonic ranging module uses the principle that ultrasonic waves will be sent back when encounter obstacles. We can measure the distance by counting the time interval between sending and receiving of the ultrasonic waves, and the time difference is the total time of the ultrasonic wave's journey from being transmitted to being received. Because the speed of sound in air is a constant, about $v=340\text{m/s}$, we can calculate the distance between the ultrasonic ranging module and the obstacle: $s=vt/2$.

The HC-SR04 ultrasonic ranging module integrates both an ultrasonic transmitter and a receiver. The transmitter is used to convert electrical signals (electrical energy) into high frequency (beyond human hearing) sound waves (mechanical energy) and the function of the receiver is opposite of this. The picture and the diagram of the HC SR04 ultrasonic ranging module are shown below:

Pin description:

Pin	Description
VCC	power supply pin
Trig	trigger pin
Echo	Echo pin
GND	GND

Technical specs:

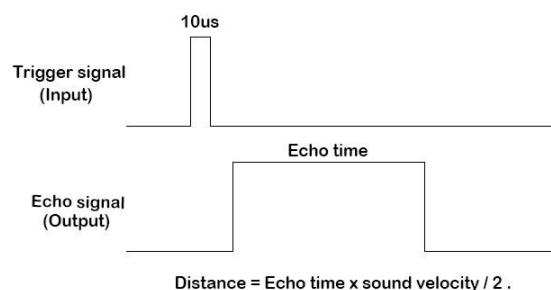

Working voltage: 5V

Working current: 12mA

Minimum measured distance: 2cm

Maximum measured distance: 200cm

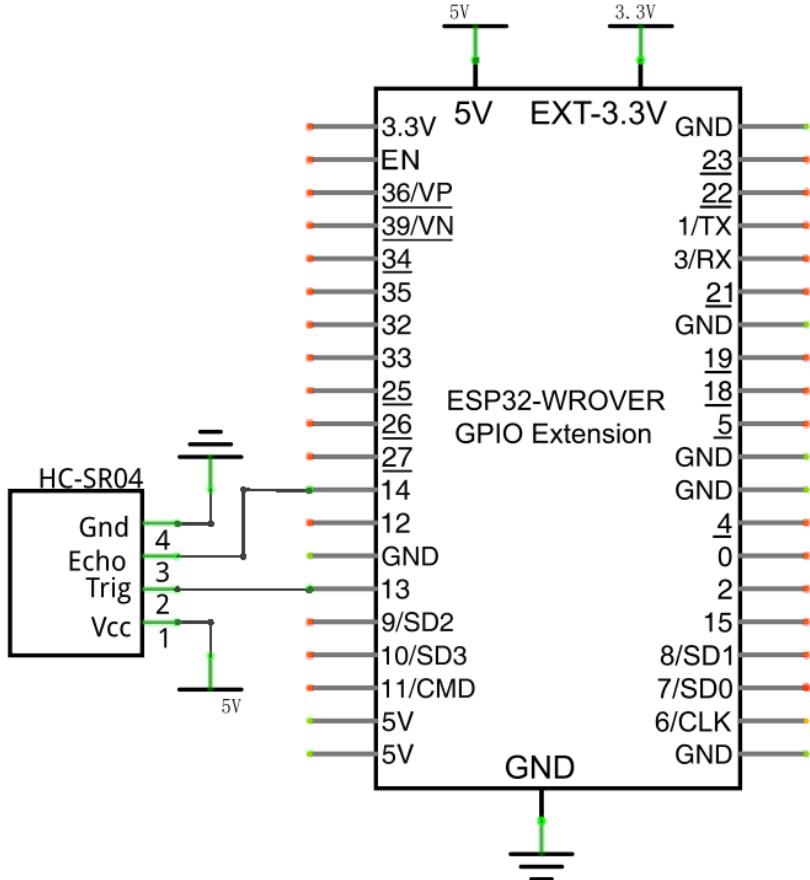

Instructions for use: output a high-level pulse in Trig pin lasting for least 10us, the module begins to transmit ultrasonic waves. At the same time, the Echo pin is pulled up. When the module receives the returned ultrasonic waves from encountering an obstacle, the Echo pin will be pulled down. The duration of high level in the Echo pin is the total time of the ultrasonic wave from transmitting to receiving, $s=vt/2$.

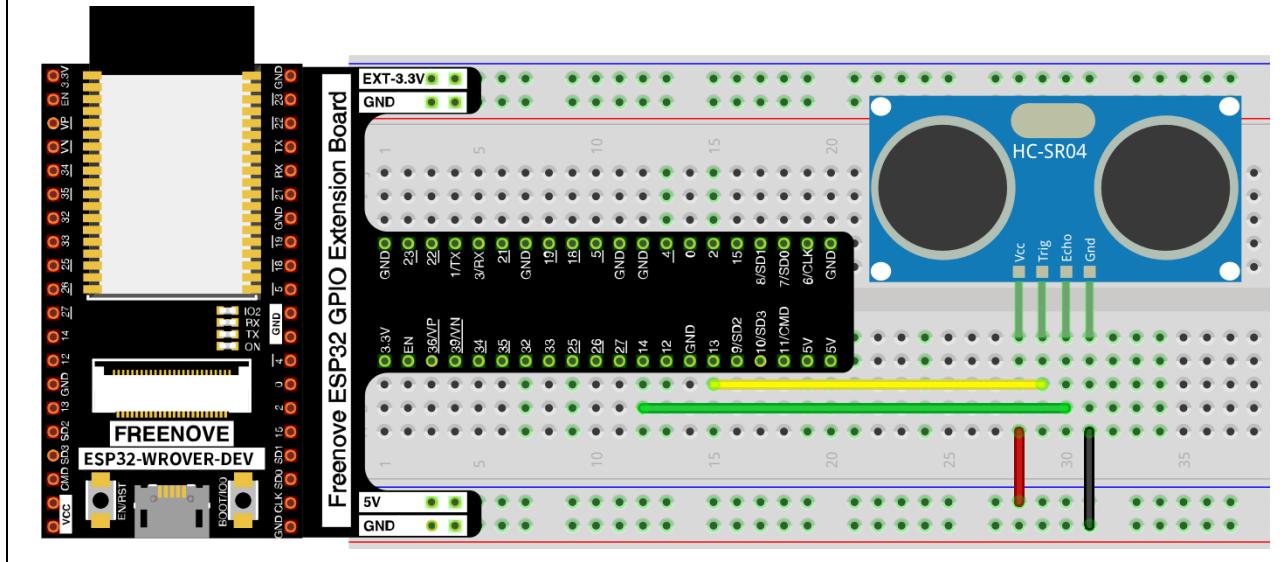

Circuit

Note that the voltage of ultrasonic module is 5V in the circuit.

Sketch

Sketch_19.1_Ultrasonic_Ranging

The screenshot shows the Arduino IDE interface with the following details:

- Title Bar:** Sketch_21.1_Ultrasonic_Ranging | Arduino 1.8.13 Hourly Build 2020/02/19 03:33
- Menu Bar:** File Edit Sketch Tools Help
- Toolbar:** Standard toolbar icons for file operations.
- Sketch Name:** Sketch_21.1_Ultrasonic_Ranging
- Code Area:** The main code area contains the following C++ code for ultrasonic ranging:

```
1 // ****
2   Filename    : Ultrasonic Ranging
3   Description : Use the ultrasonic module to measure the distance.
4   Author      : www.freenove.com
5   Modification: 2020-3-4
6 ****
7 #define trigPin 13 // define TrigPin
8 #define echoPin 14 // define EchoPin.
9 #define MAX_DISTANCE 700 // Maximum sensor distance is rated at 400-500cm.
10 //timeOut= 2*MAX_DISTANCE /100 /340 *1000000 = MAX_DISTANCE*58.8
11 float timeOut = MAX_DISTANCE * 60;
12 int soundVelocity = 340; // define sound speed=340m/s
13
14 void setup() {
15   pinMode(trigPin,OUTPUT);// set trigPin to output mode
16   pinMode(echoPin,INPUT); // set echoPin to input mode
17   Serial.begin(115200); // Open serial monitor at 115200 baud to see ping results.
18 }
19
20 void loop() {
21   delay(100); // Wait 100ms between pings (about 20 pings/sec).
22   Serial.print("Distance: ");
23   Serial.print(getSonar()); // Send ping, get distance in cm and print result
24   Serial.println("cm");
25 }
26
27 float getSonar() {
28   unsigned long pingTime;
29   float distance;
30   // make trigPin output high level lasting for 10us to trigger HC_SR04
31   digitalWrite(trigPin, HIGH);
32   delayMicroseconds(10);
33   digitalWrite(trigPin, LOW);
34   // Wait HC-SR04 returning to the high level and measure out this waiting time
35   pingTime = pulseIn(echoPin, HIGH, timeOut);
36   // calculate the distance according to the time
37   distance = (float)pingTime * soundVelocity / 2 / 10000;
38   return distance; // return the distance value
39 }
```

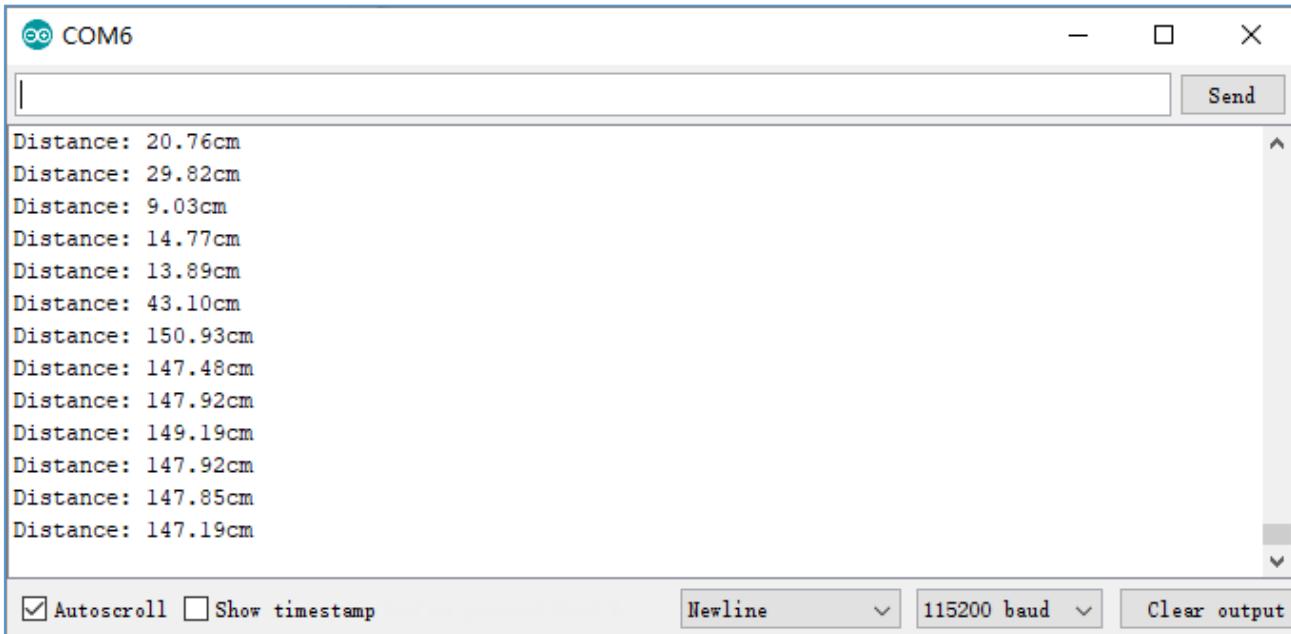

The code initializes pins 13 and 14, sets up a serial connection at 115200 baud, and defines constants for maximum distance and sound velocity. It then enters a loop where it sends a ping, receives an echo, and calculates the distance using the time of flight formula.

Serial Monitor: Shows the message "Done Saving." followed by "Leaving..." and "Hard resetting via RTS pin...".

Status Bar: Shows the page number "30" and the port "ESP32 Wrover Module on COM6".

Download the code to ESP32-WROVER, open the serial port monitor, set the baud rate to 115200 and you can use it to measure the distance between the ultrasonic module and the object. As shown in the following figure:

The following is the program code:

```

1 #define trigPin 13 // define trigPin
2 #define echoPin 14 // define echoPin.
3 #define MAX_DISTANCE 700 // Maximum sensor distance is rated at 400-500cm.
4 //timeOut= 2*MAX_DISTANCE /100 /340 *1000000 = MAX_DISTANCE*58.8
5 float timeOut = MAX_DISTANCE * 60;
6 int soundVelocity = 340; // define sound speed=340m/s
7
8 void setup() {
9     pinMode(trigPin, OUTPUT); // set trigPin to output mode
10    pinMode(echoPin, INPUT); // set echoPin to input mode
11    Serial.begin(115200); // Open serial monitor at 115200 baud to see ping results.
12 }
13
14 void loop() {
15     delay(100); // Wait 100ms between pings (about 20 pings/sec).
16     Serial.printf("Distance: ");
17     Serial.print(getSonar()); // Send ping, get distance in cm and print result
18     Serial.println("cm");
19 }
20
21 float getSonar() {
22     unsigned long pingTime;
23     float distance;
24     // make trigPin output high level lasting for 10us to trigger HC_SR04

```

```

25   digitalWrite(trigPin, HIGH);
26   delayMicroseconds(10);
27   digitalWrite(trigPin, LOW);
28   // Wait HC-SR04 returning to the high level and measure out this waiting time
29   pingTime = pulseIn(echoPin, HIGH, timeOut);
30   // calculate the distance according to the time
31   distance = (float)pingTime * soundVelocity / 2 / 10000;
32   return distance; // return the distance value
33 }
```

First, define the pins and the maximum measurement distance.

```

1 #define trigPin 13 // define trigPin
2 #define echoPin 14 // define echoPin.
3 #define MAX_DISTANCE 700           //define the maximum measured distance
```

If the module does not return high level, we cannot wait for this forever, so we need to calculate the time period for the maximum distance, that is, time Out. timeOut= $2 \times \text{MAX_DISTANCE} / 100 / 340 \times 1000000$. The result of the constant part in this formula is approximately 58.8.

```
5 float timeOut = MAX_DISTANCE * 60;
```

Subfunction getSonar () function is used to start the ultrasonic module to begin measuring, and return the measured distance in cm units. In this function, first let trigPin send 10us high level to start the ultrasonic module. Then use pulseIn () to read the ultrasonic module and return the duration time of high level. Finally, the measured distance according to the time is calculated.

```

21 float getSonar() {
22   unsigned long pingTime;
23   float distance;
24   // make trigPin output high level lasting for 10 μs to trigger HC-SR04?
25   digitalWrite(trigPin, HIGH);
26   delayMicroseconds(10);
27   digitalWrite(trigPin, LOW);
28   // Wait HC-SR04 returning to the high level and measure out this waiting time
29   pingTime = pulseIn(echoPin, HIGH, timeOut);
30   // calculate the distance according to the time
31   distance = (float)pingTime * soundVelocity / 2 / 10000;
32   return distance; // return the distance value
33 }
```

Lastly, in loop() function, get the measurement distance and display it continually.

```

14 void loop() {
15   delay(100); // Wait 100ms between pings (about 20 pings/sec).
16   Serial.printf("Distance: ");
17   Serial.print(getSonar()); // Send ping, get distance in cm and print result
18   Serial.println("cm");
19 }
```

About function **pulseIn()**:

int pulseIn(int pin, int level, int timeout);

pin: the number of the Arduino pin on which you want to read the pulse. Allowed data types: int.

value: type of pulse to read: either HIGH or LOW. Allowed data types: int.

timeout (optional): the number of microseconds to wait for the pulse to start; default is one second.

Project 19.2 Ultrasonic Ranging

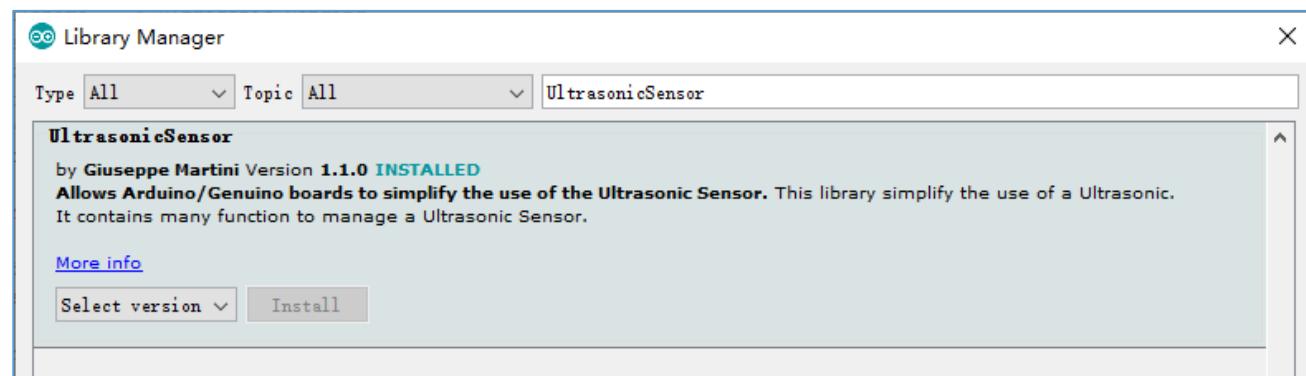

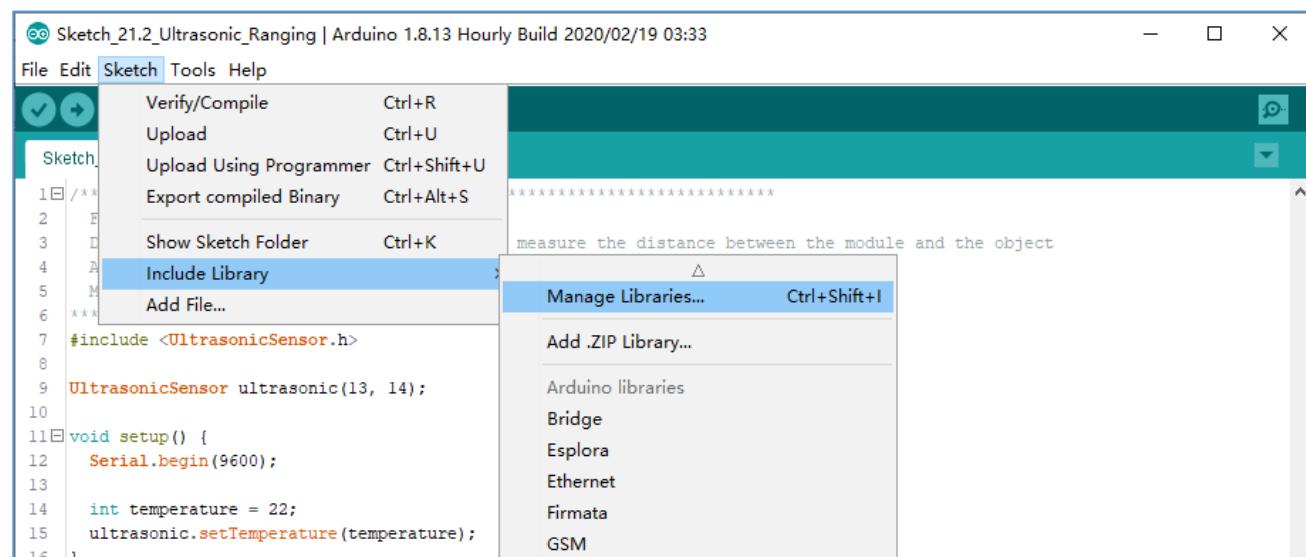

Component List and Circuit

Component List and Circuit are the same as the previous section.

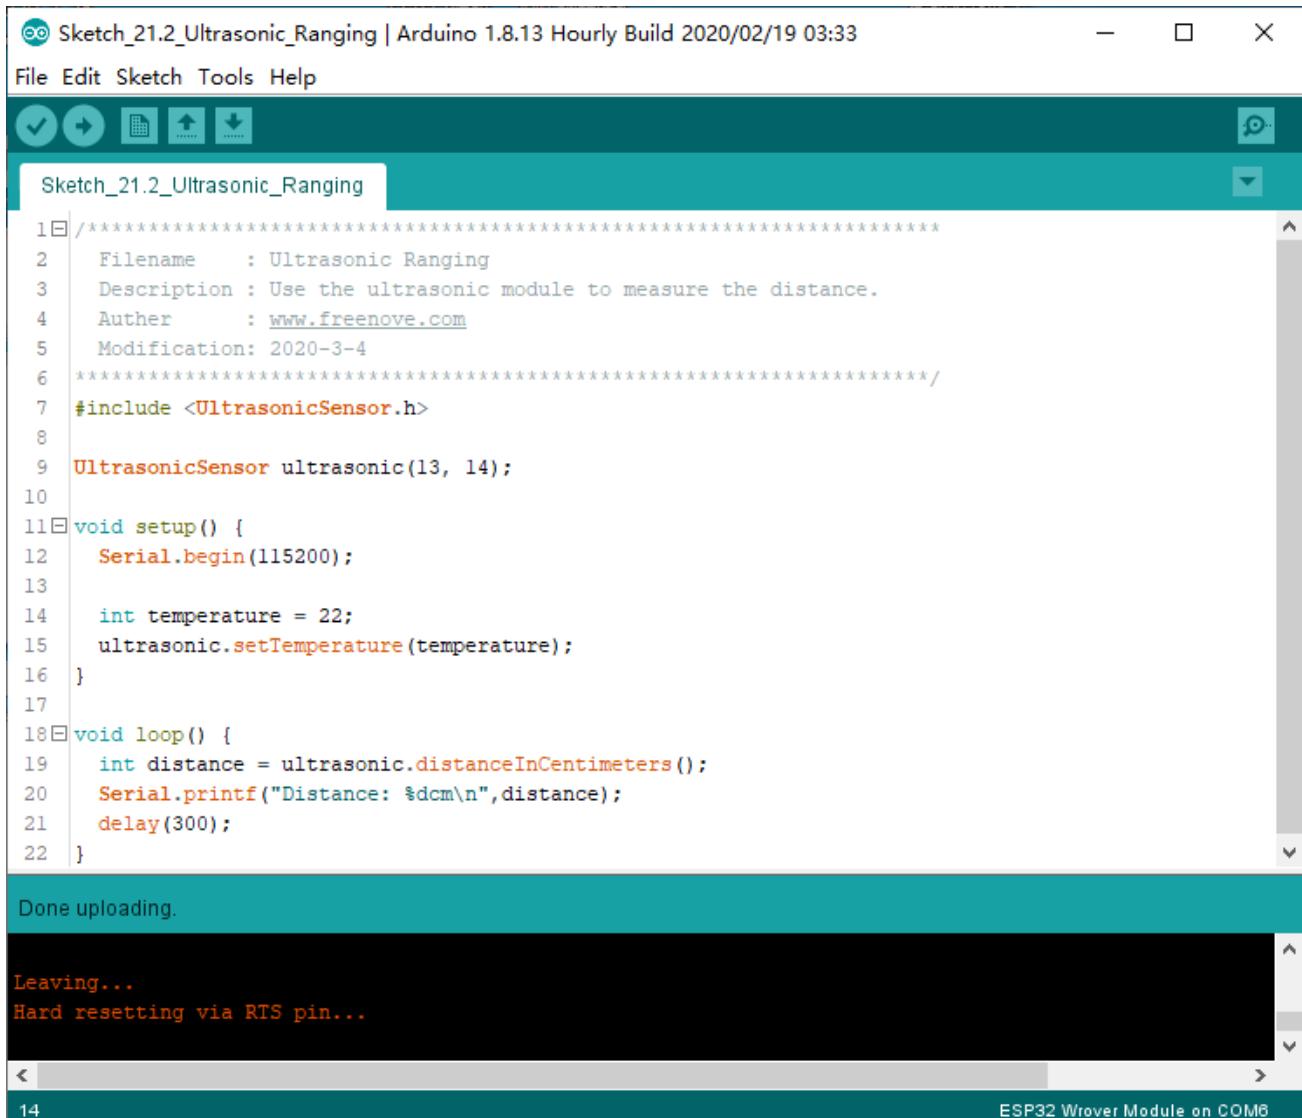

Sketch

How to install the library

We use the third party library UltrasonicSensor. If you haven't installed it yet, please do so before learning. The steps to add third-party Libraries are as follows: open arduino->Sketch->Include library-> Manage libraries. Enter "UltrasonicSensor" in the search bar and select "UltrasonicSensor" for installation. Refer to the following operations:

Sketch_19.2_Ultrasonic_Ranging

```

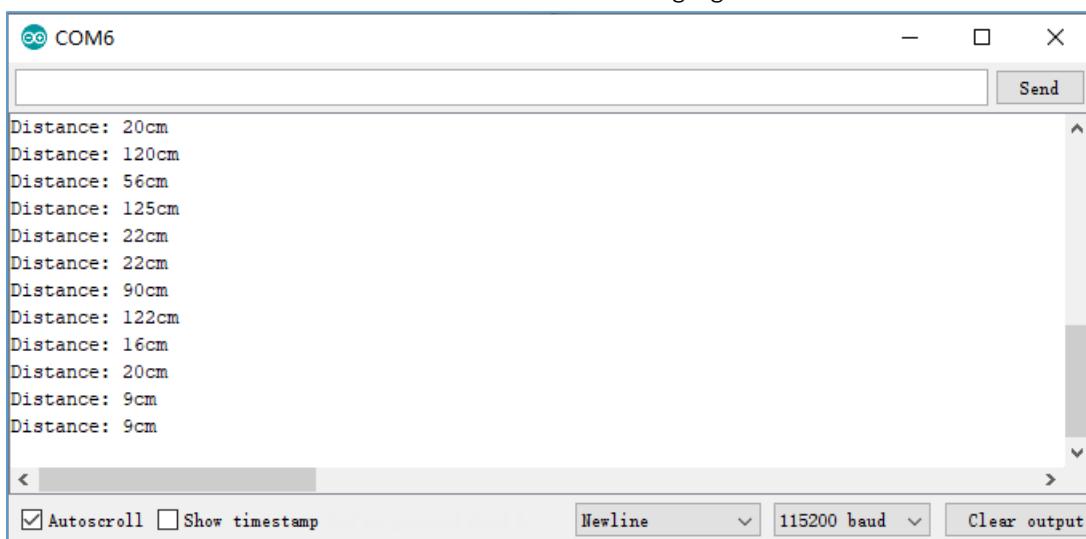

1 // ****
2   Filename    : Ultrasonic Ranging
3   Description : Use the ultrasonic module to measure the distance.
4   Author     : www.freenove.com
5   Modification: 2020-3-4
6 ****
7 #include <UltrasonicSensor.h>
8
9 UltrasonicSensor ultrasonic(13, 14);
10
11 void setup() {
12   Serial.begin(115200);
13
14   int temperature = 22;
15   ultrasonic.setTemperature(temperature);
16 }
17
18 void loop() {
19   int distance = ultrasonic.distanceInCentimeters();
20   Serial.printf("Distance: %dcm\n",distance);
21   delay(300);
22 }

```

Done uploading.

Leaving...
Hard resetting via RTS pin...

Download the code to ESP32-WROVER, open the serial port monitor, set the baud rate to 115200. Use the ultrasonic module to measure distance. As shown in the following figure:

Distance: 20cm
 Distance: 120cm
 Distance: 56cm
 Distance: 125cm
 Distance: 22cm
 Distance: 22cm
 Distance: 90cm
 Distance: 122cm
 Distance: 16cm
 Distance: 20cm
 Distance: 9cm
 Distance: 9cm

Autoscroll Show timestamp Newline 115200 baud Clear output

The following is the program code:

```

1 #include <UltrasonicSensor.h>
2 //Attach the trigger and echo pins to pins 13 and 14 of esp32
3 UltrasonicSensor ultrasonic(13, 14);
4
5 void setup() {
6     Serial.begin(115200);
7     //set the speed of sound propagation according to the temperature to reduce errors
8     int temperature = 22; //Setting ambient temperature
9     ultrasonic.setTemperature(temperature);
10 }
11
12 void loop() {
13     int distance = ultrasonic.distanceInCentimeters();
14     Serial.printf("Distance: %dcm\n", distance);
15     delay(300);
16 }
```

First, add UltrasonicSensor library.

```
1 #include <UltrasonicSensor.h>
```

Define an ultrasonic object and associate the pins.

```
3 UltrasonicSensor ultrasonic(13, 14);
```

Set the ambient temperature to make the module measure more accurately.

```
9 ultrasonic.setTemperature(temperature);
```

Use the distanceInCentimeters function to get the distance measured by the ultrasound and print it out through the serial port.

```

16 void loop() {
17     int distance = ultrasonic.distanceInCentimeters();
18     Serial.printf("Distance: %dcm\n", distance);
19     delay(300);
20 }
```

Reference

class UltrasonicSensor

class UltrasonicSensor must be instantiated when used, that is, define an object of Servo type, for example:

UltrasonicSensor ultrasonic(13, 14);

setTemperature(value): The speed of sound propagation is different at different temperatures. In order to get more accurate data, this function needs to be called. **value** is the temperature value of the current environment.

distanceInCentimeters(): The ultrasonic distance acquisition function returns the value in centimeters.

distanceInMillimeters(): The ultrasonic distance acquisition function returns the value in millimeter.

Chapter 20 Bluetooth

This chapter mainly introduces how to make simple data transmission through Bluetooth of ESP32-WROVER and mobile phones.

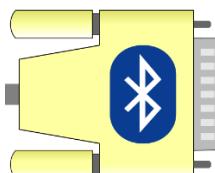

Project 20.1 is classic Bluetooth and Project 20.2 is low power Bluetooth. If you are an iPhone user, please start with Project 20.2.

Project 20.1 Bluetooth Passthrough

Component List

ESP32-WROVER x1	Micro USB Wire x1

In this tutorial we need to use a Bluetooth APP called Serial Bluetooth Terminal to assist in the experiment. If you've not installed it yet, please do so by clicking: <https://www.appsapk.com/serial-bluetooth-terminal/> The following is its logo.

Component knowledge

ESP32's integrated Bluetooth function Bluetooth is a short-distance communication system, which can be divided into two types, namely Bluetooth Low Energy(BLE) and Classic Bluetooth. There are two modes for simple data transmission: master mode and slave mode.

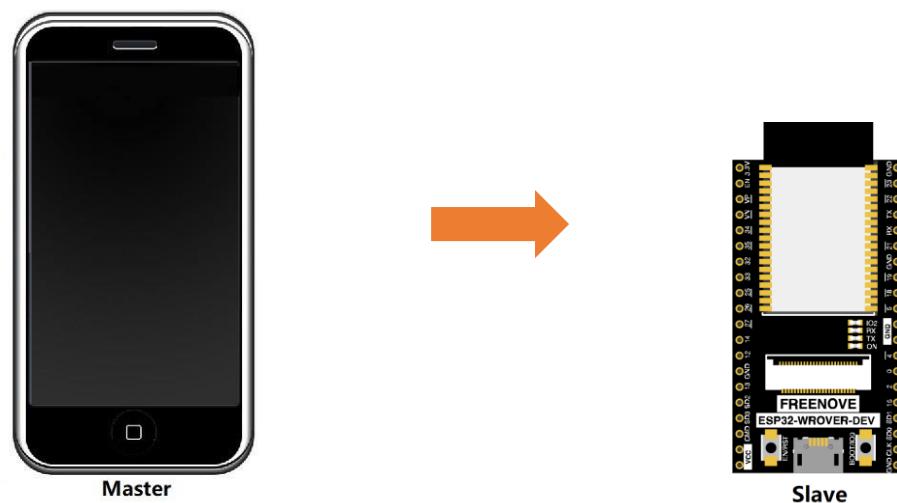

Master mode

In this mode, works are done in the master device and it can connect with a slave device. And we can search and select slave devices nearby to connect with. When a device initiates connection request in master mode, it requires information of the other Bluetooth devices including their address and pairing passkey. After finishing pairing, it can connect with them directly.

Slave mode

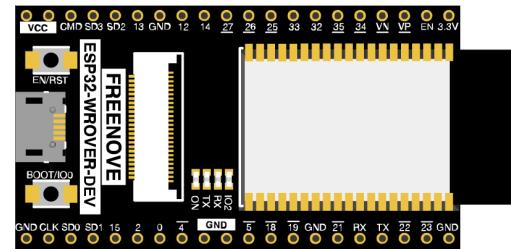

The Bluetooth module in slave mode can only accept connection request from a host computer, but cannot initiate a connection request. After connecting with a host device, it can send data to or receive from the host device.

Bluetooth devices can make data interaction with each other, as one is in master mode and the other in slave mode. When they are making data interaction, the Bluetooth device in master mode searches and selects devices nearby to connect to. When establishing connection, they can exchange data. When mobile phones exchange data with ESP32, they are usually in master mode and ESP32 in slave mode.

Circuit

Connect Freenove ESP32 to the computer using the USB cable.

Sketch

Sketch_20.1_SerialToSerialBT

The screenshot shows the Arduino IDE interface with the following details:

- Title Bar:** SerialToSerialBT | Arduino 1.8.13 Hourly Build 2020/02/19 03:33
- Menu Bar:** File Edit Sketch Tools Help
- Toolbar:** Includes icons for checkmark, play, file, upload, and download.
- Sketch Area:** The code for "SerialToSerialBT" is displayed. The code uses the "BluetoothSerial.h" library to enable serial communication over Bluetooth. It initializes the serial port at 115200 baud and starts a Bluetooth device named "ESP32test". It then enters a loop where it reads from the serial port and writes to the Bluetooth port, and vice versa.

```

1 #include "BluetoothSerial.h"
2
3 BluetoothSerial SerialBT;
4 String buffer;
5 void setup() {
6     Serial.begin(115200);
7     SerialBT.begin("ESP32test"); //Bluetooth device name
8     Serial.println("\nThe device started, now you can pair it with bluetooth!");
9 }
10
11 void loop() {
12     if (Serial.available()) {
13         SerialBT.write(Serial.read());
14     }
15     if (SerialBT.available()) {
16         Serial.write(SerialBT.read());
17     }
18     delay(20);
19 }
20

```

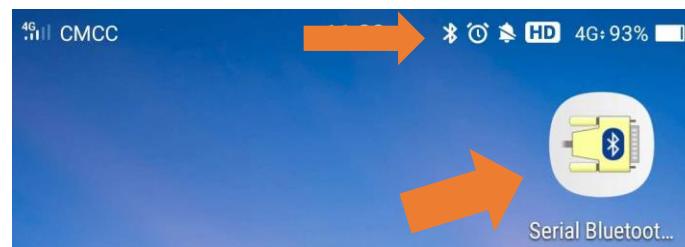

- Status Bar:** Shows "Done Saving." and "Leaving... Hard resetting via RTS pin...".

Compile and upload the code to the ESP32-WROVER, open the serial monitor, and set the baud rate to 115200. When you see the serial printing out the character string as below, it indicates that the Bluetooth of ESP32 is ready and waiting to connect with the mobile phone.

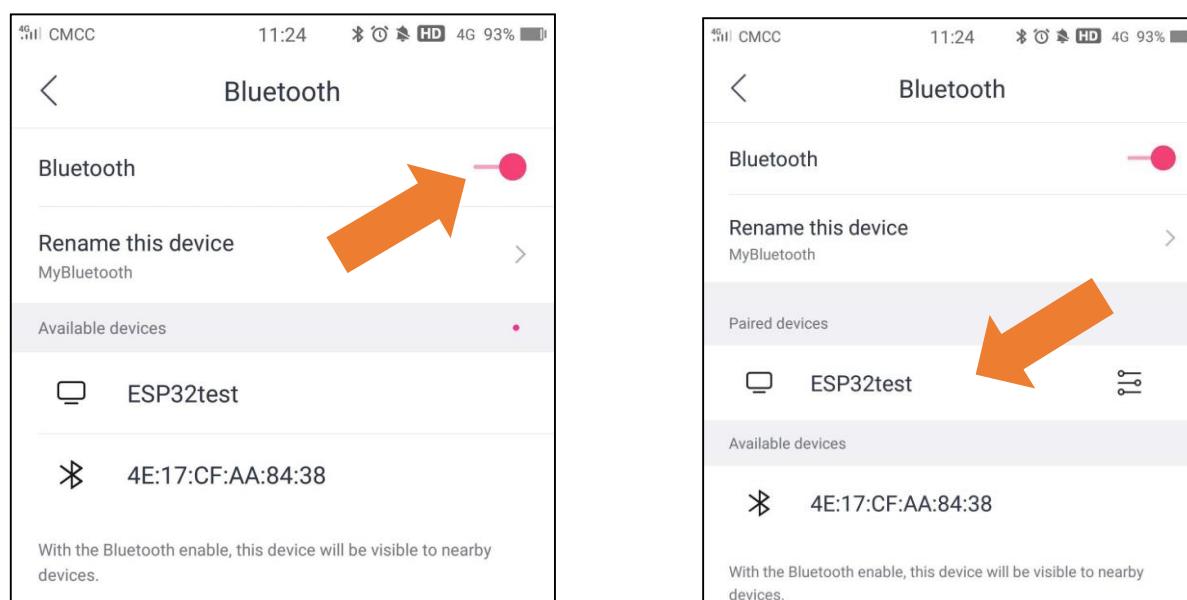

```
The device started, now you can pair it with bluetooth!
```

Autoscroll Show timestamp Newline 115200 baud Clear output

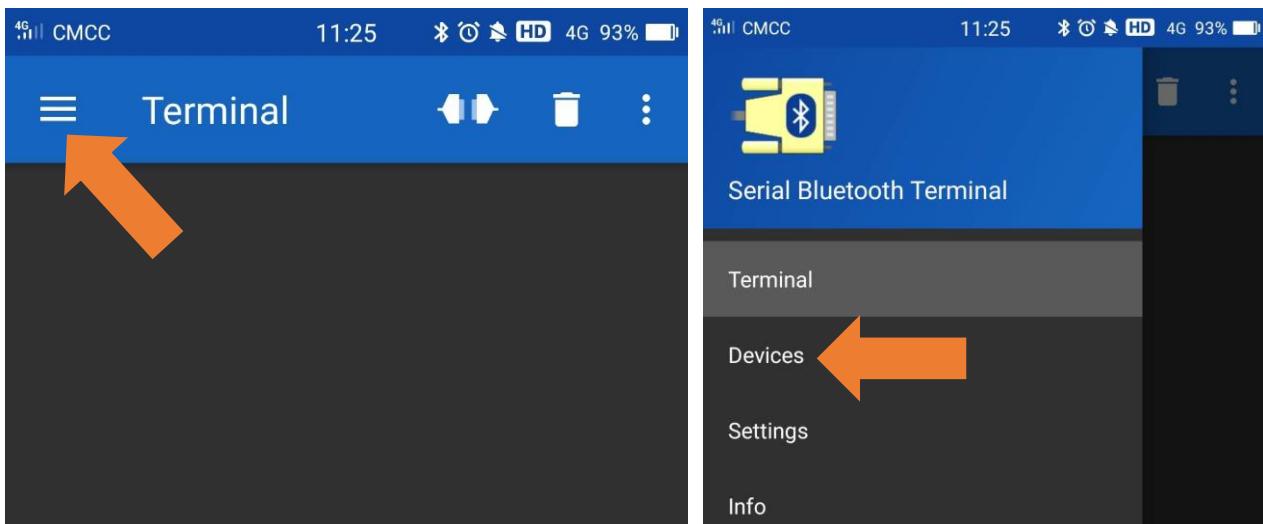

Make sure that the Bluetooth of your phone has been turned on and Serial Bluetooth Terminal has been installed.

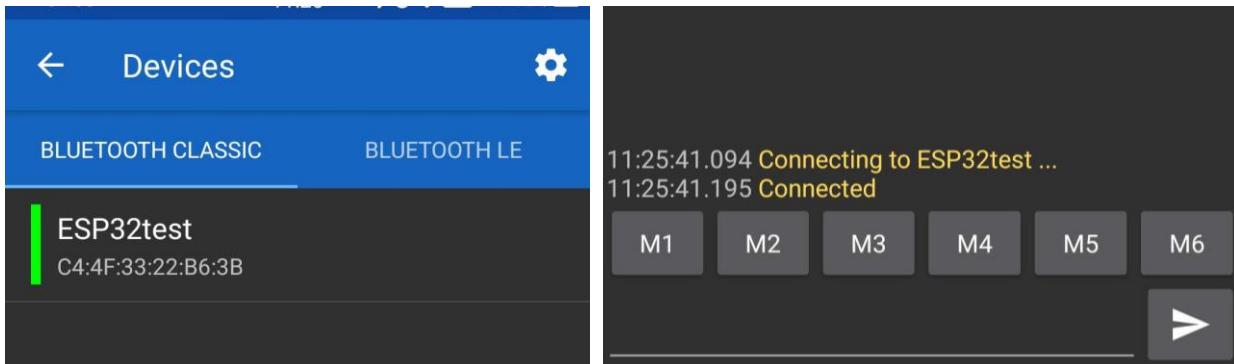

Click "Search" to search Bluetooth devices nearby and select "ESP32 test" to connect to.

Turn on software APP, click the left of the terminal. Select "Devices"

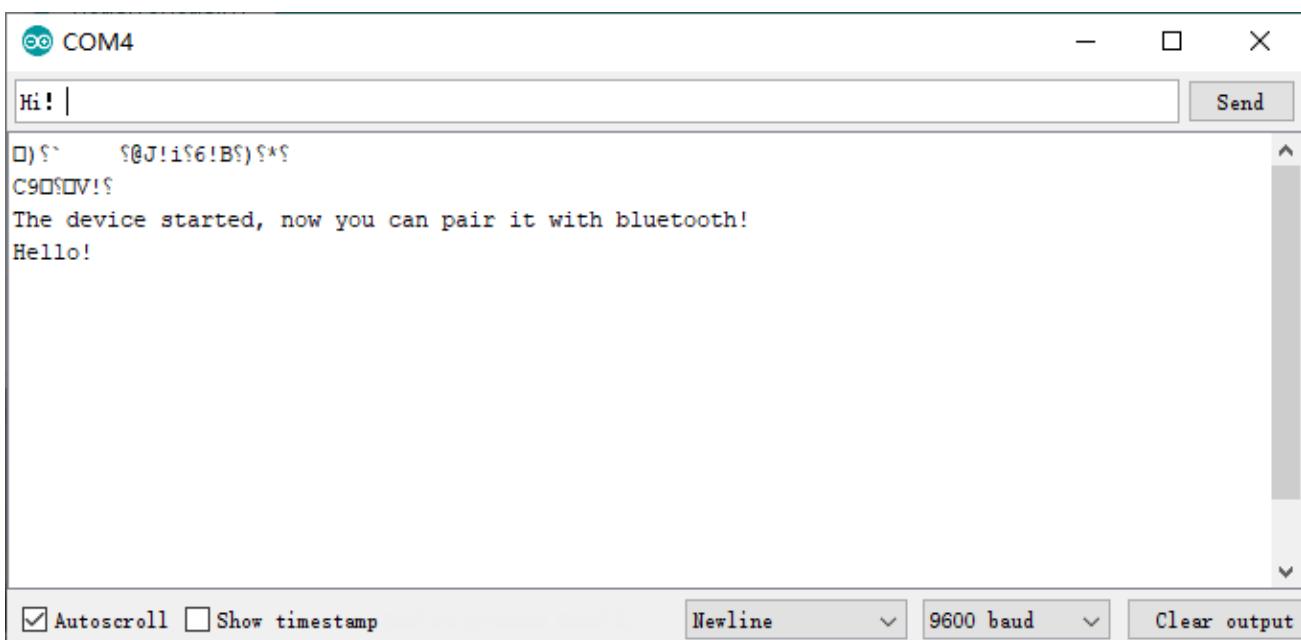

Select ESP32test in classic Bluetooth mode, and a successful connecting prompt will appear as shown on the right illustration.

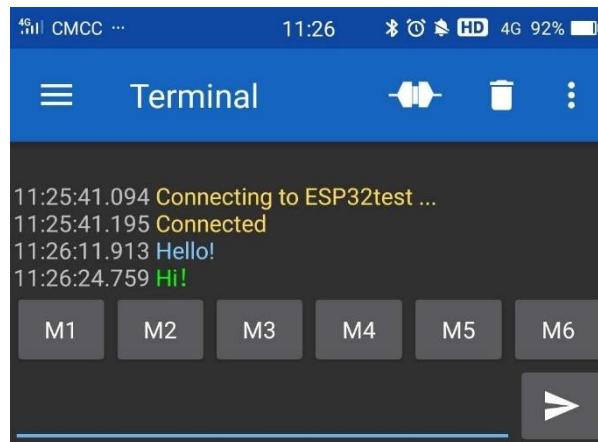

And now data can be transferred between your mobile phone and computer via ESP32-WROVER.

Send 'Hello!' from your phone, when the computer receives it, reply "Hi" to your phone.

Any concerns? [✉ support@freenove.com](mailto:support@freenove.com)

Reference

Class BluetoothSerial

This is a class library used to operate **BluetoothSerial**, which can directly read and set **BluetoothSerial**.

Here are some member functions:

begin(localName, isMaster): Initialization function of the Bluetooth

name: name of Bluetooth module; Data type: String

isMaster: bool type, whether to set Bluetooth as Master. By default, it is false.

available(): acquire digits sent from the buffer, if not, return 0.

read(): read data from Bluetooth, data type of return value is int.

readString(): read data from Bluetooth, data type of return value is String.

write(val): send an int data val to Bluetooth.

write(str): send an SString data str to Bluetooth.

write(buf, len): Sends the first len data in the buf Array to Bluetooth.

setPin(const char *pin): set a four-digit Bluetooth pairing code. By default, it is 1234

connect(remoteName): connect a Bluetooth named remoteName, data type: String

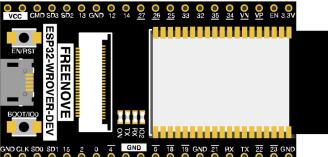

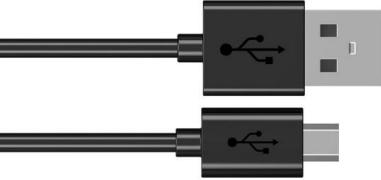

connect(remoteAddress []): connect the physical address of Bluetooth, data type: uint8-t.

disconnect(): disconnect all Bluetooth devices.

end(): disconnect all Bluetooth devices and turn off the Bluetooth, release all occupied space

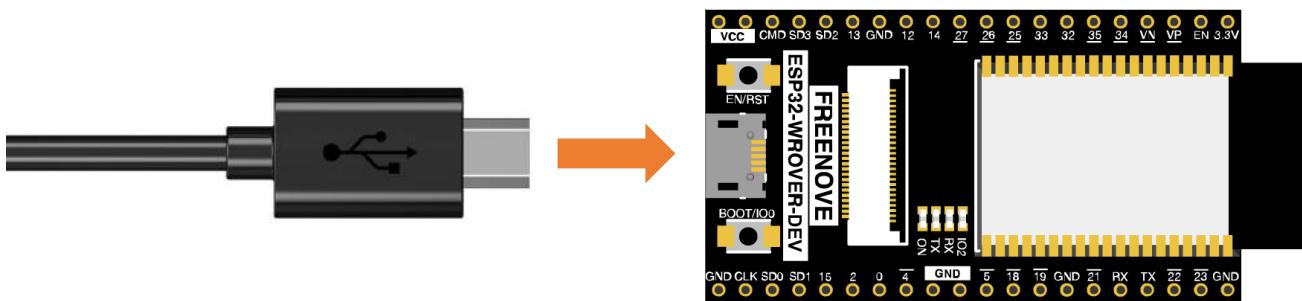

Project 20.2 Bluetooth Low Energy Data Passthrough

Component List

ESP32-WROVER x1	Micro USB Wire x1
	

Circuit

Connect Freenove ESP32 to the computer using the USB cable.

Sketch

Sketch 20.2 BLE

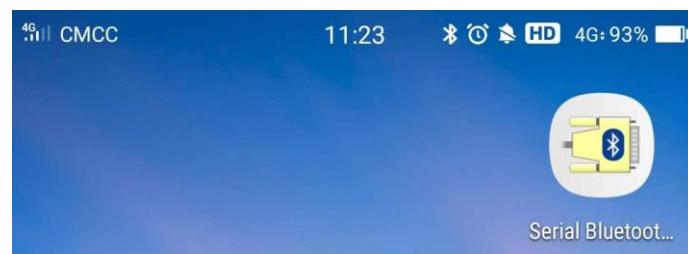

The screenshot shows the Arduino IDE interface with the following details:

- Title Bar:** BLE_uart | Arduino 1.8.13 Hourly Build 2020/02/19 03:33
- Menu Bar:** File Edit Sketch Tools Help
- Toolbar:** Includes icons for Save, Upload, Download, and a refresh symbol.
- Sketch Area:** The code for **BLE_uart** is displayed. The code handles serial communication and BLE connections. It includes functions for setup and loop, using Serial.begin(115200), setupBLE("ESP32_Bluetooth"), and processing data from rxload and Serial.available().
- Serial Monitor:** Shows the message "Done uploading." followed by "Leaving... Hard resetting via RTS pin..."

Serial Bluetooth

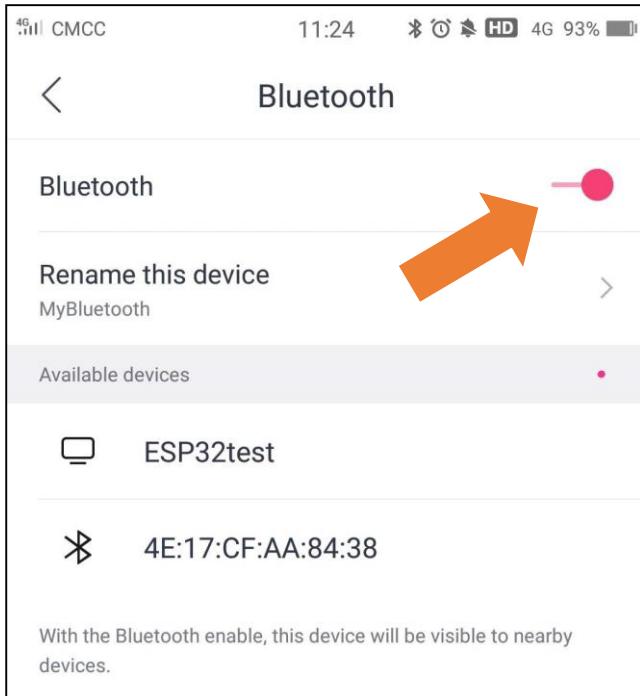

Compile and upload code to ESP32, the operation is similar to the last section.

First, make sure you've turned on the mobile phone Bluetooth, and then open the software.

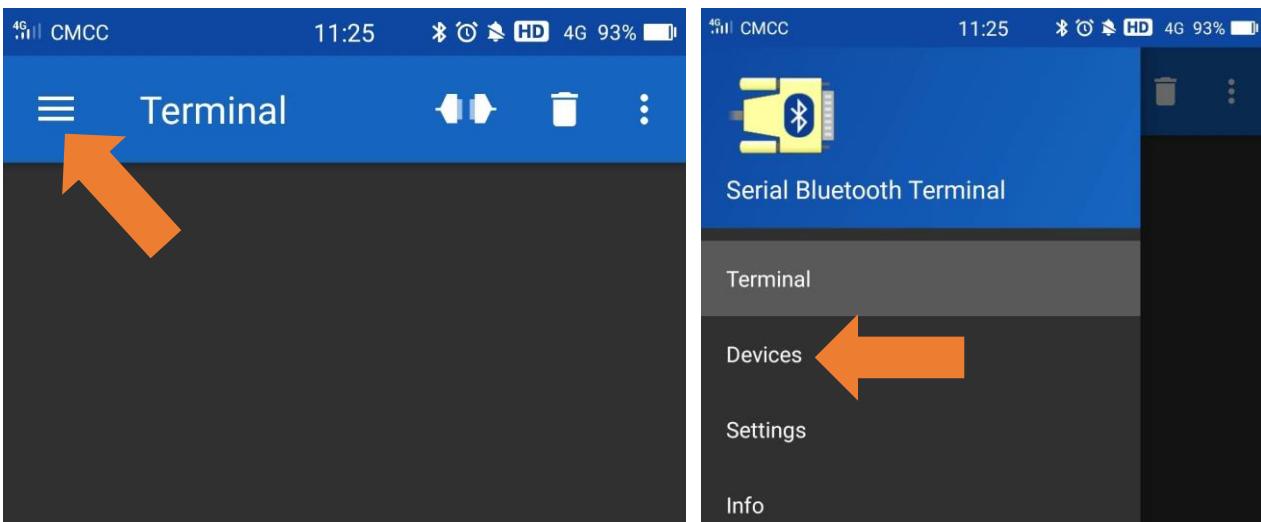

Any concerns? ✉ support@freenove.com

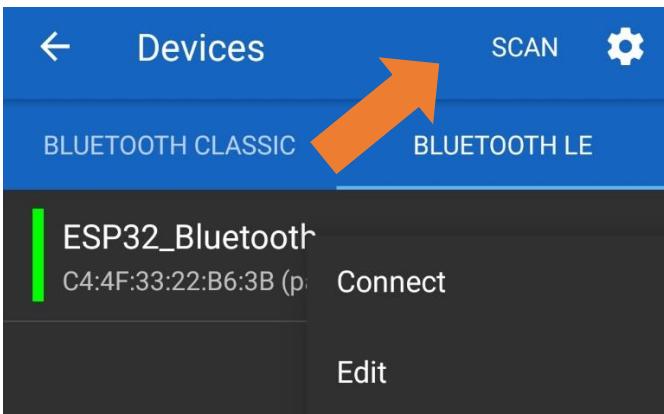

Click "Search" to search Bluetooth devices nearby and select "ESP32 test" to connect to.

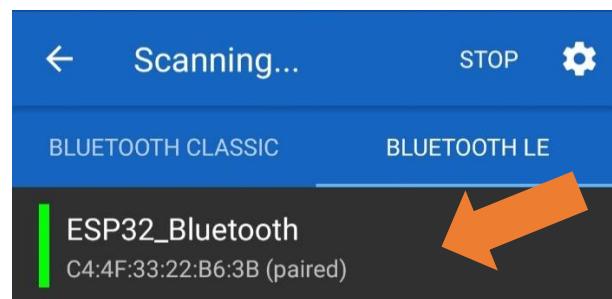

Turn on software APP, click the left of the terminal. Select "Devices"

Select BLUETOOTHLE, click SCAN to scan Low Energy Bluetooth devices nearby.

Select "ESP32-Bluetooth"

Lightblue

If you can't install Serial Bluetooth on your phone, try LightBlue. If you do not have this software installed on your phone, you can refer to this link:

<https://apps.apple.com/us/app/lightblue/id557428110#?platform=iphone.>

The screenshot displays the LightBlue app interface on an iPhone. On the left, there's a list of nearby peripherals, including 'Health Monitor', 'Matt's Mug', 'Thed's Arduino Uno', 'Gretchen's Fitbit Blaze', 'Heart Rate Monitor', 'Colin's iPhone Xs', 'Sous Vide Bean', 'Mike's MacBook Pro', 'PT DevKit', and another 'Health Monitor'. On the right, a detailed view of a connected 'Temperature Measurement' peripheral is shown. The peripheral has a UUID of A33A86B-F6FF-456B-B8A8-F216BA278210. It shows various properties like 'Intermediate Temperature', 'Temperature Measurement', 'Temperature Type', and 'Measurement Interval'. At the bottom, there are settings for 'Byte Count' and 'Endianness'.

Step1. Upload the code of Project27.2 to ESP32.

Step2. Click on serial monitor.

```

Compiling sketch...

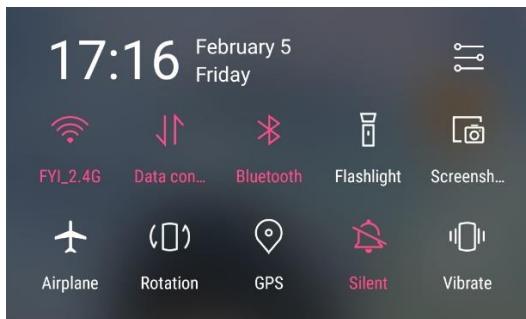

E:\arduino\arduino-1.8.13\arduino-builder -dump-prefs -logger=machine -hardware E:\arduino\arduino-1.8.13\hardware -hardware C:\Users\PCVA\Documents\Arduino\Hardware\ESP32_Wrover_Module\Default\

ESP32 Wrover Module, Default, QIO, 80MHz, 921600, None on COM5

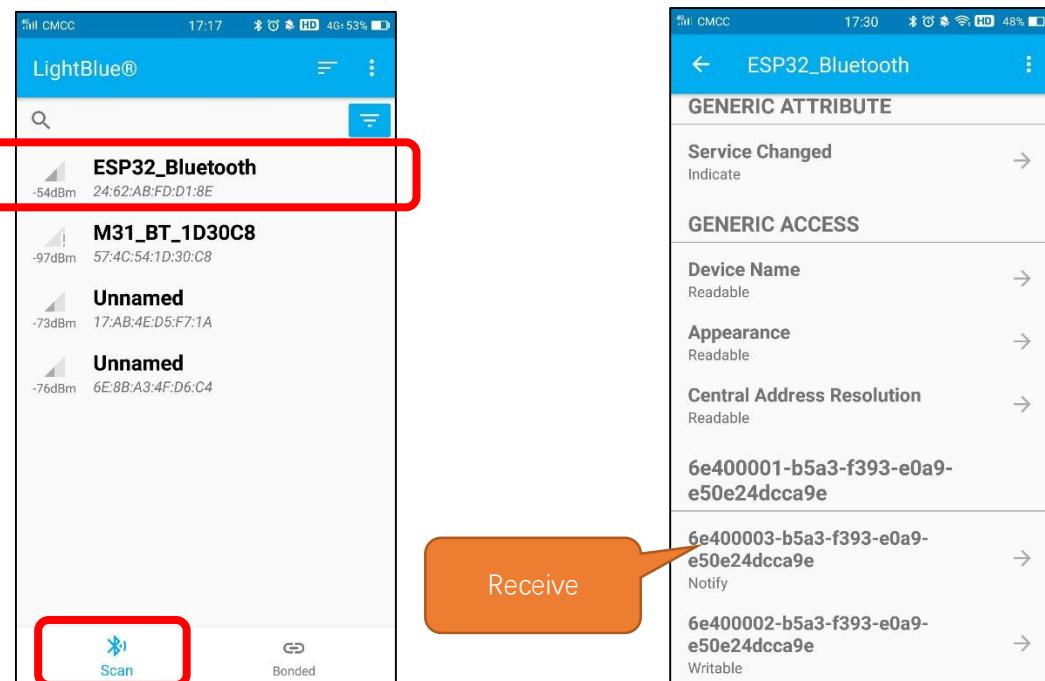

Step3. Set baud rate to 9600.

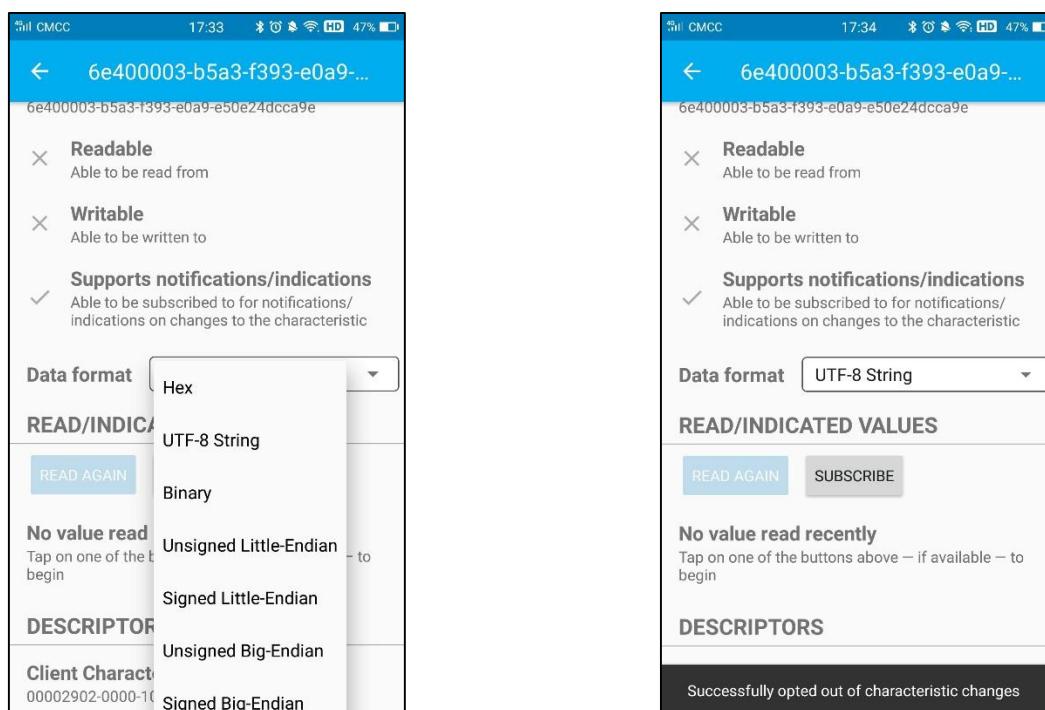

Turn ON Bluetooth on your phone, and open the Lightblue APP.

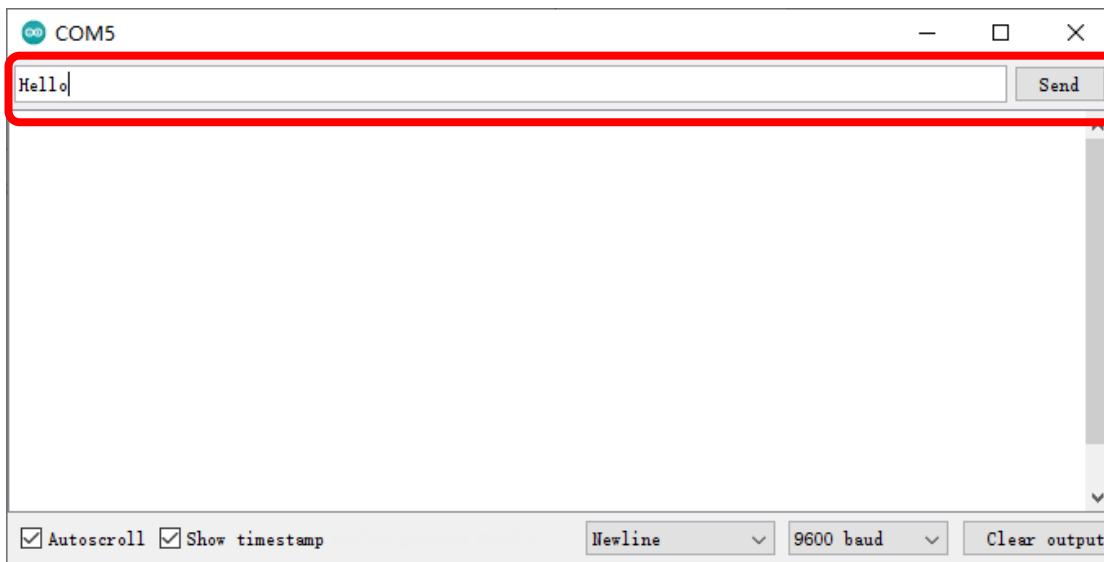

In the Scan page, swipe down to refresh the name of Bluetooth that the phone searches for. Click ESP32_Bluetooth.

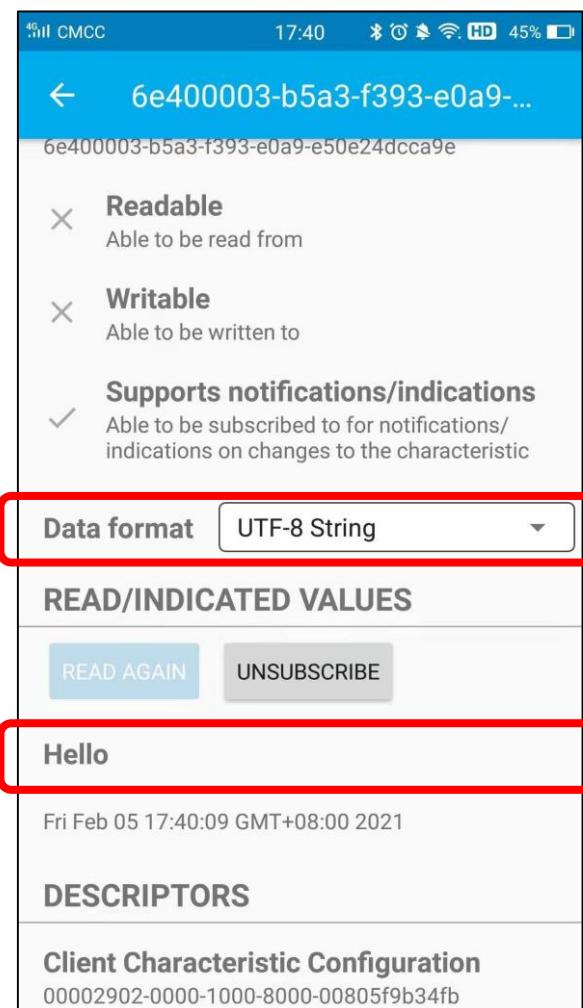

Click "Receive". Select the appropriate Data format in the box to the right of Data Format. For example, HEX for hexadecimal, utf-string for character, Binary for Binary, etc. Then click SUBSCRIBE.

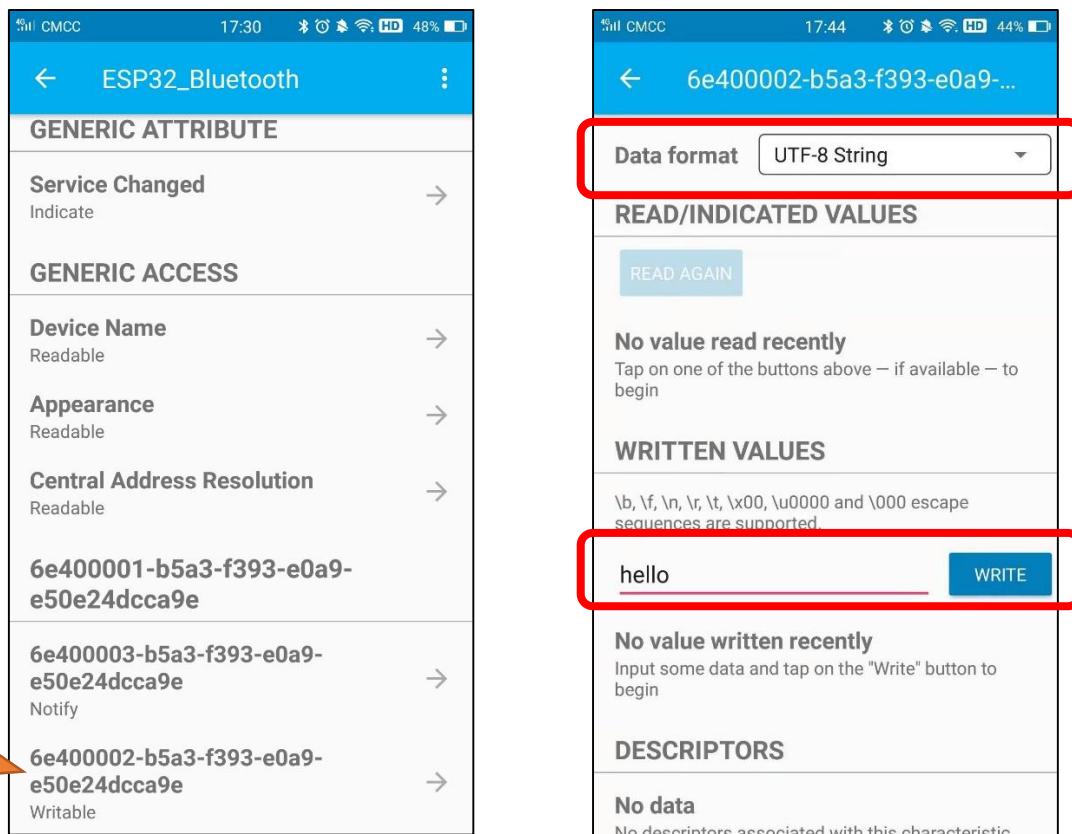

Back to the serial monitor on your computer. You can type anything in the left border of Send, and then click Send.

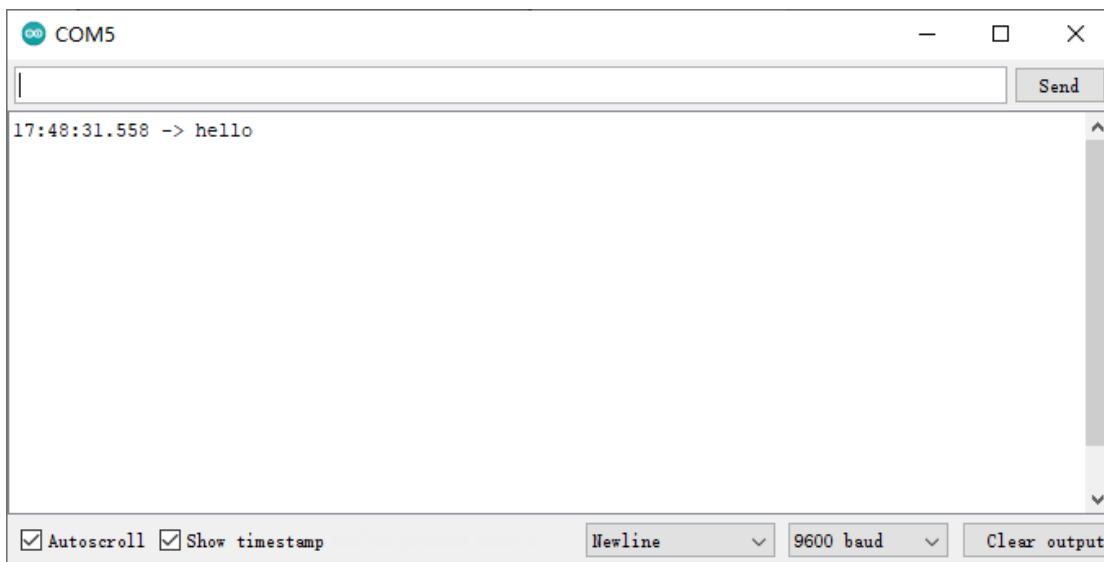

And then you can see the mobile Bluetooth has received the message.

Similarly, you can select “Send” on your phone. Set Data format, and then enter anything in the sending box and click Write to send.

And the computer will receive the message from the mobile Bluetooth.

And now data can be transferred between your mobile phone and computer via ESP32-WROVER.

The following is the program code:

```
1 #include <BLEDevice.h>
2 #include <BLEServer.h>
3 #include <BLEUtils.h>
4 #include <BLE2902.h>
5 #include <String.h>
6
7 BLECharacteristic *pCharacteristic;

15 #define CHARACTERISTIC_UUID_TX "6E400003-B5A3-F393-E0A9-E50E24DCCA9E"
16
17 class MyServerCallbacks: public BLEServerCallbacks {
18     void onConnect(BLEServer* pServer) {
19         deviceConnected = true;
20     };
21     void onDisconnect(BLEServer* pServer) {
22         deviceConnected = false;
23     }
24 };
25
26 class MyCallbacks: public BLECharacteristicCallbacks {
27     void onWrite(BLECharacteristic *pCharacteristic) {
28         std::string rxValue = pCharacteristic->getValue();
29         if (rxValue.length() > 0) {
30             rxload="";
31             for (int i = 0; i < rxValue.length(); i++) {
32                 rxload +=(char)rxValue[i];
33             }
34         }
35     }
36 };
37
38 void setupBLE(String BLEName) {
39     const char *ble_name=BLEName.c_str();
40     BLEDevice::init(ble_name);
41     BLEServer *pServer = BLEDevice::createServer();
42     pServer->setCallbacks(new MyServerCallbacks());
```

```
43 BLEService *pService = pServer->createService(SERVICE_UUID);
44 pCharacteristic=
45 pService->createCharacteristic(CHARACTERISTIC_UUID_RX,BLECharacteristic::PROPERTY_NOTIFY);
46 pCharacteristic->addDescriptor(new BLE2902());
47 BLECharacteristic *pCharacteristic =
48 pService->createCharacteristic(CHARACTERISTIC_UUID_RX,BLECharacteristic::PROPERTY_WRITE);
49 pCharacteristic->setCallbacks(new MyCallbacks());
50 pService->start();
51 pServer->getAdvertising()->start();
52 Serial.println("Waiting a client connection to notify...");
```

53 }

```
54
55 void setup() {
56   Serial.begin(9600);
57   setupBLE("ESP32_Bluetooth");
58 }
59
60 void loop() {
61   long now = millis();
62   if (now - lastMsg > 1000) {
63     if (deviceConnected&&rxload.length()>0) {
64       Serial.println(rxload);
65       rxload="";
66     }
67     if(Serial.available()>0) {
68       String str=Serial.readString();
69       const char *newValue=str.c_str();
70       pCharacteristic->setValue(newValue);
71       pCharacteristic->notify();
72     }
73   }
74 }
```

Define the specified UUID number for BLE vendor.

```
13 #define SERVICE_UUID          "6E400001-B5A3-F393-E0A9-E50E24DCCA9E"
14 #define CHARACTERISTIC_UUID_RX "6E400002-B5A3-F393-E0A9-E50E24DCCA9E"
15 #define CHARACTERISTIC_UUID_TX "6E400003-B5A3-F393-E0A9-E50E24DCCA9E"
```

Write a Callback function for BLE server to manage connection of BLE.

```

17 class MyServerCallbacks: public BLEServerCallbacks {
18     void onConnect(BLEServer* pServer) {
19         deviceConnected = true;
20     };
21     void onDisconnect(BLEServer* pServer) {
22         deviceConnected = false;
23     }
24 };

```

Write Callback function with BLE features. When it is called, as the mobile terminal send data to ESP32, it will store them into reload.

```

26 class MyCallbacks: public BLECharacteristicCallbacks {
27     void onWrite(BLECharacteristic *pCharacteristic) {
28         std::string rxValue = pCharacteristic->getValue();
29         if (rxValue.length() > 0) {
30             rxload="";
31             for (int i = 0; i < rxValue.length(); i++) {
32                 rxload +=(char)rxValue[i];
33             }
34         }
35     }
36 };

```

Initialize the BLE function and name it.

```
55 setupBLE("ESP32_Bluetooth");
```

When the mobile phone send data to ESP32 via BLE Bluetooth, it will print them out with serial port; When the serial port of ESP32 receive data, it will send them to mobile via BLE Bluetooth.

```

59 long now = millis();
60 if (now - lastMsg > 1000) {
61     if (deviceConnected&&rxload.length()>0) {
62         Serial.println(rxload);
63         rxload="";
64     }
65     if(Serial.available()>0) {
66         String str=Serial.readString();
67         const char *newValue=str.c_str();
68         pCharacteristic->setValue(newValue);
69         pCharacteristic->notify();
70     }
71     lastMsg = now;
72 }

```

The design for creating the BLE server is:

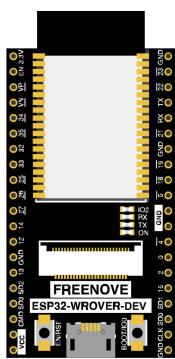

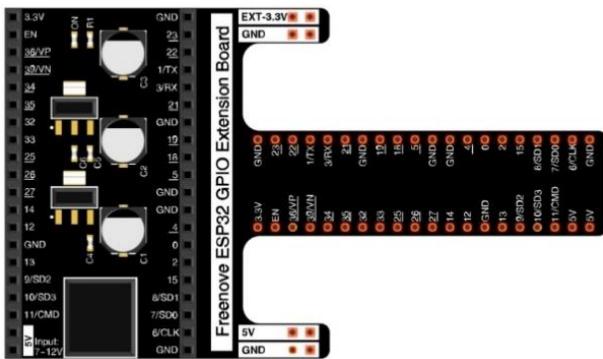

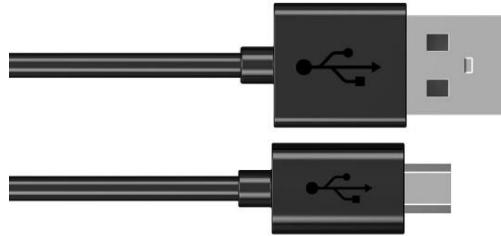

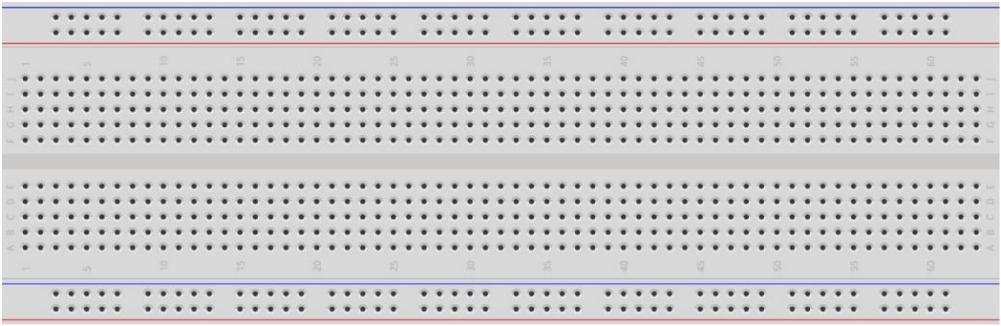

1. Create a BLE Server
2. Create a BLE Service
3. Create a BLE Characteristic on the Service
4. Create a BLE Descriptor on the characteristic
5. Start the service.
6. Start advertising.

```
38 void setupBLE(String BLEName) {  
39     const char *ble_name=BLEName.c_str();  
40     BLEDevice::init(ble_name);  
41     BLEServer *pServer = BLEDevice::createServer();  
42     pServer->setCallbacks(new MyServerCallbacks());  
43     BLEService *pService = pServer->createService(SERVICE_UUID);  
44     pCharacteristic=  
45         pService->createCharacteristic(CHARACTERISTIC_UUID_TX,BLECharacteristic::PROPERTY_NOTIFY);  
46     pCharacteristic->addDescriptor(new BLE2902());  
47     BLECharacteristic *pCharacteristic =  
48         pService->createCharacteristic(CHARACTERISTIC_UUID_RX,BLECharacteristic::PROPERTY_WRITE);  
49     pCharacteristic->setCallbacks(new MyCallbacks());  
50     pService->start();  
51     pServer->getAdvertising()->start();  
52     Serial.println("Waiting a client connection to notify...");  
53 }
```

Project 20.3 Bluetooth Control LED

In this section, we will control the LED with Bluetooth.

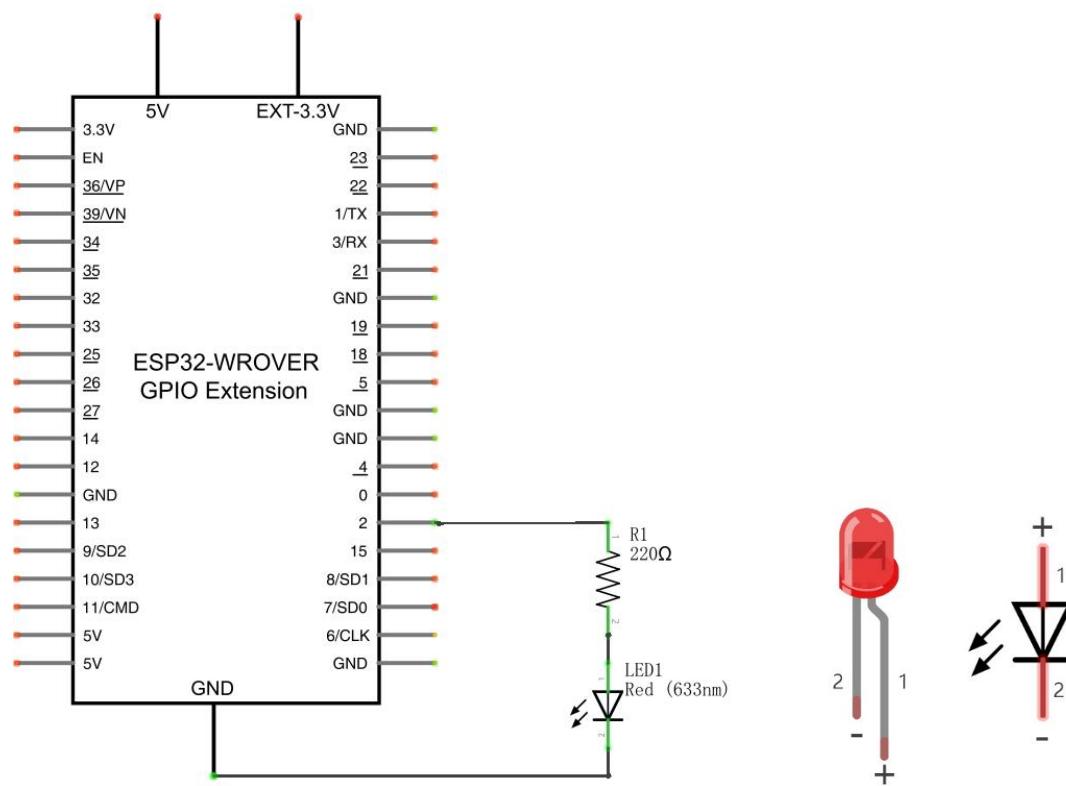

Component List

ESP32-WROVER x1	GPIO Extension Board x1		
			
Micro USB Wire x1	LED x1	Resistor 220Ω x1	Jumper M/M x2
			
Breadboard x1			
			

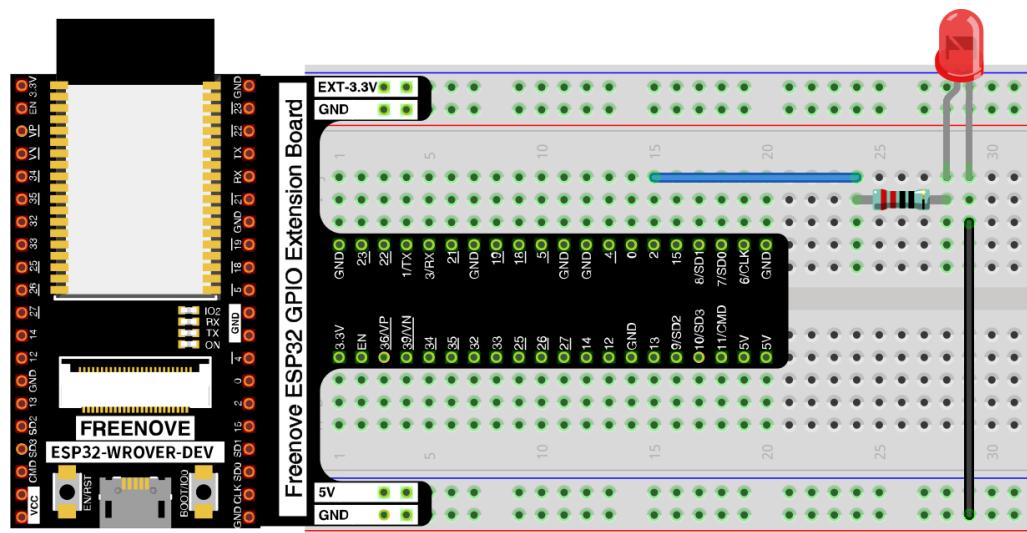

Circuit

Connect Freenove ESP32 to the computer using a USB cable.

Schematic diagram

Hardware connection. If you need any support, please contact us via: support@freenove.com

bluetoothToLed

```
1 #include "BluetoothSerial.h"
2 #include "string.h"
3 #define LED 2
4 BluetoothSerial SerialBT;
5 char buffer[20];
6 static int count = 0;
7 void setup() {
8     pinMode(LED, OUTPUT);
9     SerialBT.begin("ESP32test"); //Bluetooth device name
10    Serial.begin(115200);
11    Serial.println("\nThe device started, now you can pair it with bluetooth!");
12 }
13
14 void loop() {
15     while(SerialBT.available())
16     {
17         buffer[count] = SerialBT.read();
18         count++;
19     }
20     if(count>0){
21         Serial.print(buffer);
22         if(strncmp(buffer,"led_on",6)==0) {
23             digitalWrite(LED,HIGH);
24         }
25         if(strncmp(buffer,"led_off",7)==0) {
26             digitalWrite(LED,LOW);
27         }
28         count=0;
29         memset(buffer,0,20);
30     }
31 }
```

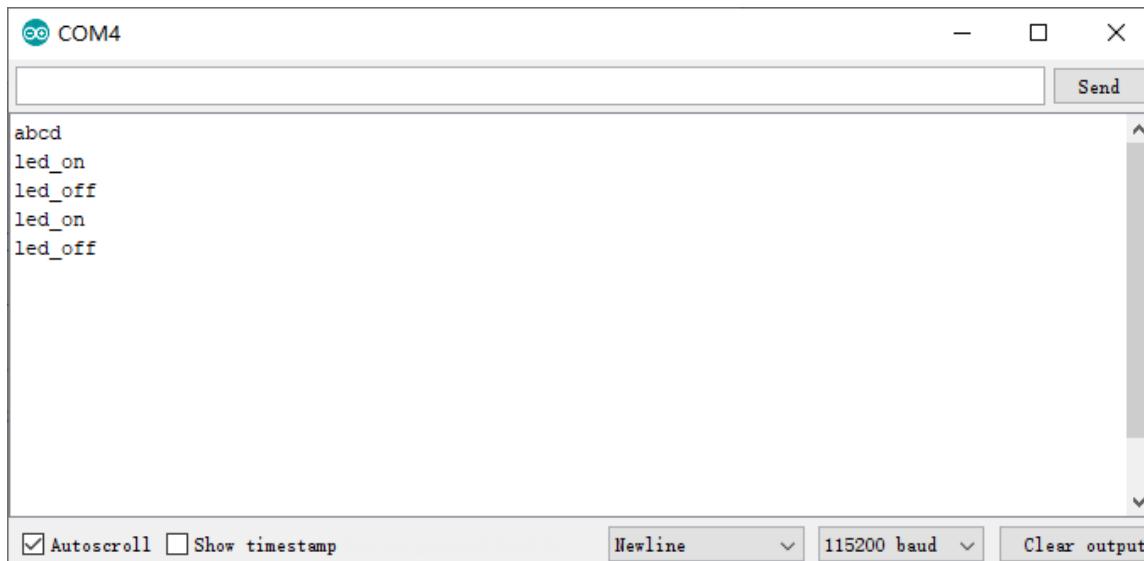

Leaving...
Hard resetting via RTS pin...

Compile and upload code to ESP32. The operation of the APP is the same as 27.1, you only need to change the sending content to "led_on" and "led_off" to operate LEDs on the ESP32-WROVER.

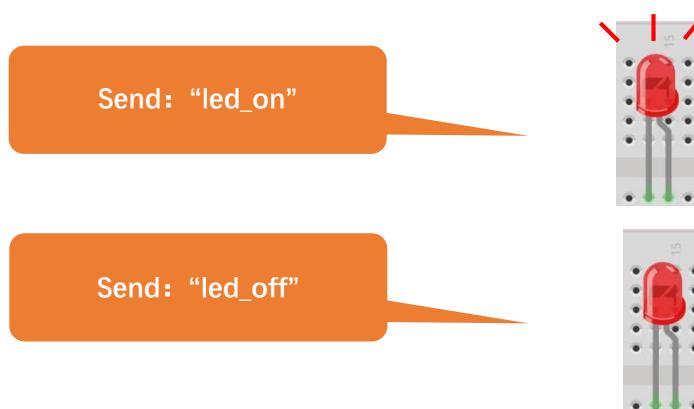

Data sent from mobile APP:

Display on the serial port of the computer:

The phenomenon of LED

Attention: If the sending content isn't "led-on" or "led-off", then the state of LED will not change. If the LED is on, when receiving irrelevant content, it keeps on; Correspondingly, if the LED is off, when receiving irrelevant content, it keeps off.

Any concerns? ✉ support@freenove.com

The following is the program code:

```

1 #include "BluetoothSerial.h"
2 #include "string.h"
3 #define LED 2
4 BluetoothSerial SerialBT;
5 char buffer[20];
6 static int count = 0;
7 void setup() {
8     pinMode(LED, OUTPUT);
9     SerialBT.begin("ESP32test"); //Bluetooth device name
10    Serial.begin(115200);
11    Serial.println("\The device started, now you can pair it with Bluetooth! ");
12 }
13
14 void loop() {
15     while(SerialBT.available())
16     {
17         buffer[count] = SerialBT.read();
18         count++;
19     }
20     if(count>0){
21         Serial.print(buffer);
22         if(strncmp(buffer, "led_on", 6)==0) {
23             digitalWrite(LED, HIGH);
24         }
25         if(strncmp(buffer, "led_off", 7)==0) {
26             digitalWrite(LED, LOW);
27         }
28         count=0;
29         memset(buffer, 0, 20);
30     }
31 }
```

Use character string to handle function header file.

```
1 #include "string.h"
```

Define a buffer to receive data from Bluetooth, and use "count" to record the bytes of data received.

```

17 char buffer[20];
18 static int count = 0;
```

Initialize the classic Bluetooth and name it as "ESP32test"

```
26 SerialBT.begin("ESP32test"); //Bluetooth device name
```

When receive data, read the Bluetooth data and store it into buffer array.

```
15   while(SerialBT.available()) {
16       buffer[count] = SerialBT.read();
17       count++;
18   }
```

Compare the content in buffer array with "led_on" and "led_off" to see whether they are the same. If yes, execute the corresponding operation.

```
22   if(strncmp(buffer, "led_on", 6)==0) {
23       digitalWrite(LED, HIGH);
24   }
25   if(strncmp(buffer, "led_off", 7)==0) {
26       digitalWrite(LED, LOW);
27   }
```

After comparing the content of array, to ensure successful transmission next time, please empty the array and set the count to zero.

```
28   count=0;
29   memset(buffer, 0, 20);
```

Reference

strncmp() functions are often used for string comparisons, which are accurate and stable.

```
int strncmp(const char *str1, const char *str2, size_t n)
```

str1: the first string to be compared

str2: the second string to be compared

n: the biggest string to be compared

Return value: if str1>str2, then return value>0.

If return value is 0, then the contents of str1 and str2 are the same.

If str1< str2, then return value<0.

Function memset is mainly used to clean and initialize the memory of array

```
void *memset(void *s, int c, unsigned long n)
```

Function memset() is to set the content of a certain internal storage as specified value.

*s: the initial address of the content to clear out.

c:to be replaced as specified value

n: the number of byte to be replaced

Chapter 21 Bluetooth Media by DAC

ESP32 integrates Classic Bluetooth and Bluetooth Low Energy(BLE). It can transmit not only simple data and orders, but also files including texts and audios. In this section, we will utilize the audio's receiving function of Bluetooth to receive music from mobile phones and play it.

Project 21.1 Playing Bluetooth Music through DAC

Use the Bluetooth audio receiving function of ESP32 to transcode the audio data from mobile phones and play the music through DAC output pin.

The accuracy of ESP32's DAC is only eight bits, so the music would be distorted to some extent using this tutorial. In order to highlight the difference between having and not having an iis decoder, we recommend learning Chapter 29.

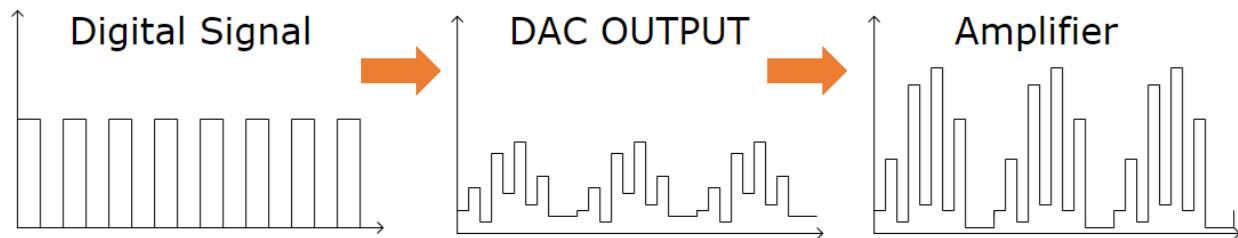

Component List

ESP32-WROVER x1	GPIO Extension Board x1		
A small black rectangular module with two long yellow header pins on the right side. It has various pins labeled with numbers and letters (e.g., 3.3V, GND, SDA, SCL, I2C, D0-D22, D13-D15, D16-D17, D18-D19, D21-D22, D23-D24, D25-D26, D27-D28, D29-D30, D31-D32, D33-D34, D35-D36, Micro USB Wire x1	Speaker		
A standard micro USB cable with two black plastic connectors.	A circular speaker icon with a central hole and a red terminal wire.		
NPN transistorx1 (S8050)	Diode x1	Resistor 1kΩ x1	Capacitor 10uF x1
A small black component with three pins: a flat base, a vertical collector, and a vertical emitter.	A small black component with two pins: a flat cathode end and a vertical anode end.	A small black component with two pins and a color-coded band indicating its value.	A small black cylindrical component with two pins.

Component knowledge

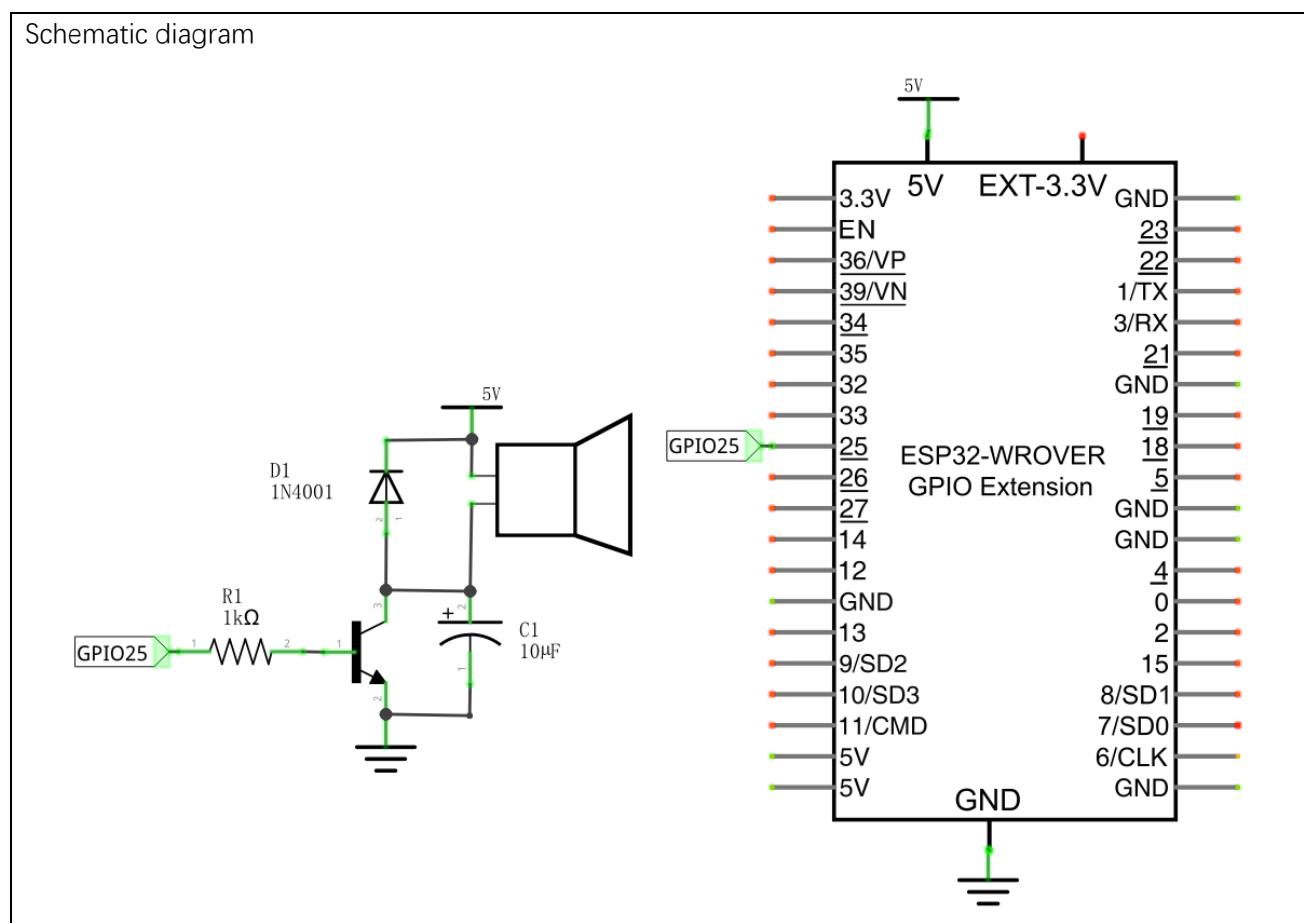

signal conversion

Bluetooth devices receive music data from mobile devices, which cannot play through earphones and speakers directly. To output DAC signal, Bluetooth devices need to decode these data with I2S decoding chip. The power of these audio signals is so small that it can only drive low-power music listening devices, such as earphone. Amplify the power of these DAC signals with power amplifier chip, so that it can drive relatively bigger-power music playing devices, such as speakers.

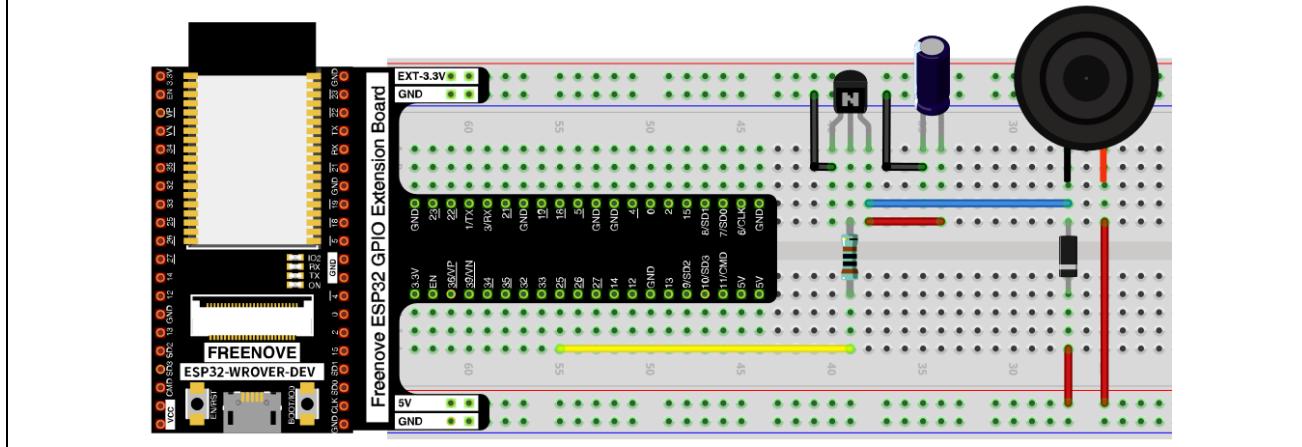

In this chapter, we use ESP32-WROVER's built-in audio decoding feature to convert the received Bluetooth data directly into an audio signal and output it via ESP32-WROVER's DAC pin.

Circuit

Hardware connection. If you need any support, please free to contact us via: support@freenove.com

Sketch

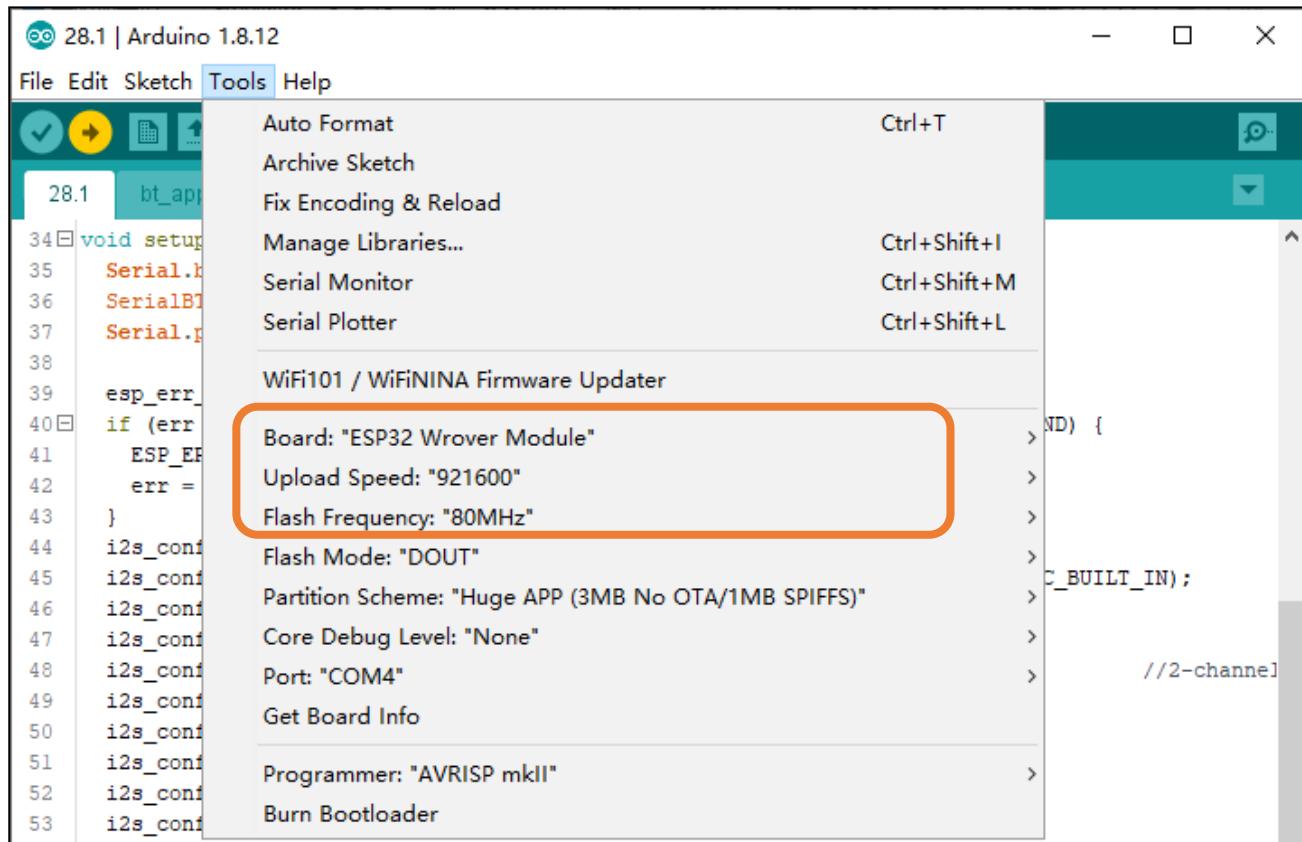

Before compiling the code, follow these steps for the setting:

- 1, "Tools" → "Partition Scheme" → "Huge APP (3MB No OTA/1MB SPIFFS)";
- 2, "Tools" → "Flash Mode" → "DOUT";
- 3, "Tools" → "Flash Frequency" → "80MHz";

You can refer to the following picture for configuration

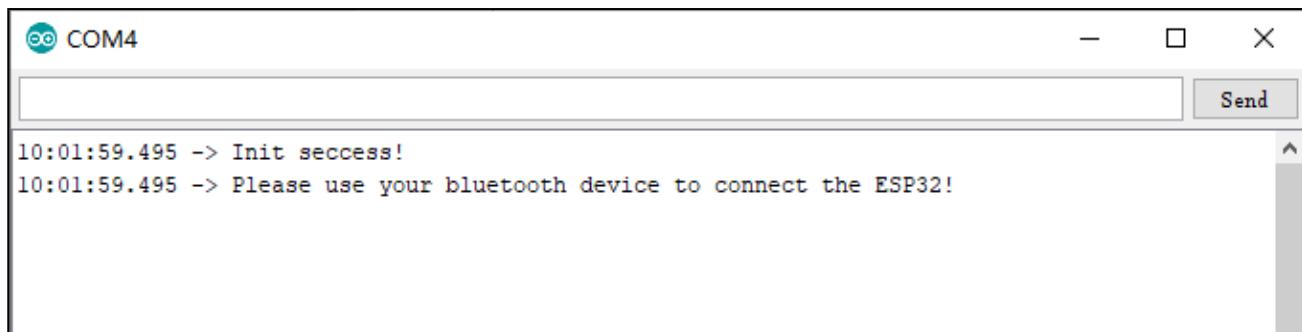

[Sketch_21.1_Bluetooth_Music_by_DAC](#)

Note: ESP32 board support packages are different and will cause compilation failures. We provide two codes, if you can't use it, please change another code.

Any concerns? [✉ support@freenove.com](mailto:support@freenove.com)

Compile and upload the code to the ESP32-WROVER and open the serial monitor. ESP32 takes a few seconds to initialize the program. When you see the prompt as shown in the figure below, it means that the Bluetooth function of ESP32 is ready and waiting for the connection of other Bluetooth devices.

The screenshot shows a Windows-style serial monitor window titled "COM4". The text area contains two lines of blue text: "10:01:59.495 -> Init seccess!" and "10:01:59.495 -> Please use your bluetooth device to connect the ESP32!". A "Send" button is visible in the top right corner.

Please use your mobile phone to search and connect a Bluetooth device named "ESP32". After the connection is successful, you can use ESP32 to play the audio files in your mobile phone.

The following is the program code:

```
1 #include "BluetoothSerial.h"
2 #include "driver/i2s.h"
3 #include "nvs.h"
4 #include "nvs_flash.h"

56 i2s_set_pin(I2S_NUM_0, NULL);            //Set the output pin as GPIO25
```

Initialize the Bluetooth hardware device, establish a Bluetooth thread task, and print out messages to prompt the user to take the next step.

```

58 esp_bluedroid_init();
59 esp_bluedroid_enable();
60 bt_app_task_start_up();
```

Any concerns? ✉ support@freenove.com

```
61     bt_app_work_dispatch(bt_av_hdl_stack_evt, 0, NULL, 0, NULL);  
62     Serial.println("Please use your Bluetooth device to connect the ESP32! ");
```

Bluetooth thread task: Set Bluetooth to slave mode; initialize Bluetooth command resolution function; set Bluetooth to be visible to other devices and in waiting for connection mode.

```
20 static void bt_av_hdl_stack_evt(uint16_t event, void *p_param) {  
21     if(event==0) {  
22         /* initialize A2DP sink */  
23         esp_a2d_register_callback(&bt_app_a2d_cb);  
24         esp_a2d_sink_register_data_callback(bt_app_a2d_data_cb);  
25         esp_a2d_sink_init();  
26         /* initialize AVRCP controller */  
27         esp_avrc_ct_init();  
28         esp_avrc_ct_register_callback(bt_app_rc_ct_cb);  
29         /* set discoverable and connectable mode, wait to be connected */  
30         esp_bt_gap_set_scan_mode(ESP_BT_SCAN_MODE_CONNECTABLE_DISCOVERABLE);  
31     }  
32 }
```

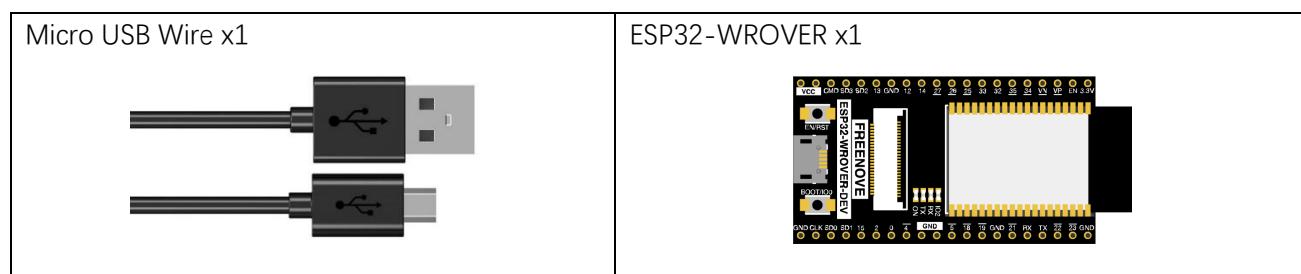

Chapter 22 WiFi Working Modes

In this chapter, we'll focus on the WiFi infrastructure for ESP32-WROVER.

ESP32-WROVER has 3 different WiFi operating modes: station mode, AP mode and AP+station mode. All WiFi programming projects must be configured with WiFi operating mode before using WiFi, otherwise WiFi cannot be used.

Project 22.1 Station mode

Component List

Component knowledge

Station mode

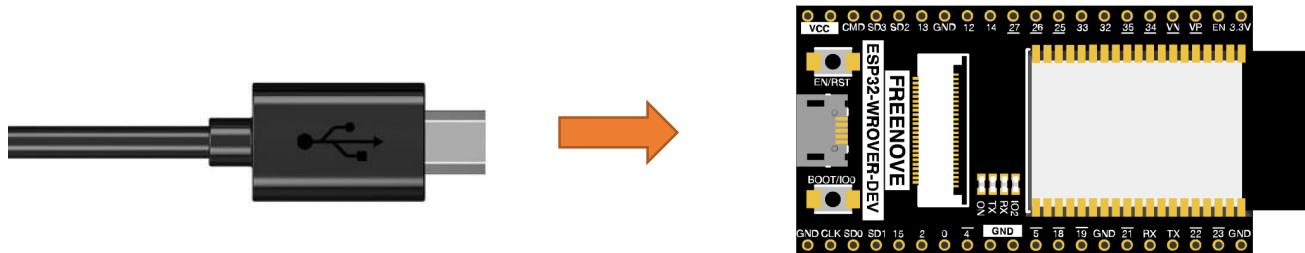

When ESP32 selects Station mode, it acts as a WiFi client. It can connect to the router network and communicate with other devices on the router via WiFi connection. As shown below, the PC is connected to the router, and if ESP32 wants to communicate with the PC, it needs to be connected to the router.

Any concerns? ✉ support@freenove.com

Circuit

Connect Freenove ESP32 to the computer using the USB cable.

Sketch

Sketch_22.1_Station_mode

The screenshot shows the Arduino IDE interface with the sketch named 'Sketch_22.1_Station_mode'. The code is as follows:

```

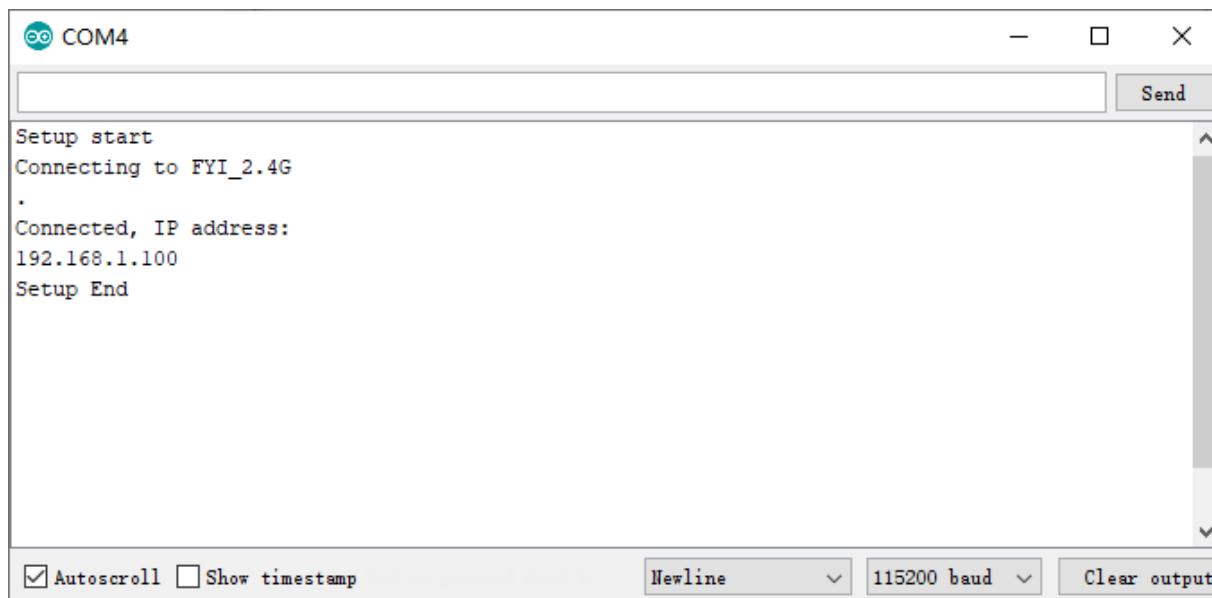

1 #include <WiFi.h>
2
3 const char *ssid_Router = "*****"; //Enter the router name
4 const char *password_Router = "*****"; //Enter the router password
5
6 void setup() {
7     Serial.begin(115200);
8     delay(2000);
9     Serial.println("Setup start");
10    WiFi.begin(ssid_Router, password_Router);
11    Serial.println(String("Connecting to ") + ssid_Router);
12    while (WiFi.status() != WL_CONNECTED) {
13        delay(500);
14        Serial.print(".");
15    }
16    Serial.println("\nConnected, IP address: ");
17    Serial.println(WiFi.localIP());
18    Serial.println("Setup End");
19 }
20
21 void loop() {
22 }

```

The Arduino IDE status bar at the bottom indicates 'Done uploading.' and 'Leaving... Hard resetting via RTS pin...'. The bottom right corner of the IDE window shows 'ESP32 Wrover Module on COM5'.

Because the names and passwords of routers in various places are different, before the Sketch runs, users need to enter the correct router's name and password in the box as shown in the illustration above.

After making sure the router name and password are entered correctly, compile and upload codes to ESP32-WROVER, open serial monitor and set baud rate to 115200. And then it will display as follows:

When ESP32-WROVER successfully connects to "ssid_Router", serial monitor will print out the IP address assigned to ESP32-WROVER by the router.

The following is the program code:

```
1 #include <WiFi.h>
2
3 const char *ssid_Router      = "*****"; //Enter the router name
4 const char *password_Router = "*****"; //Enter the router password
5
6 void setup() {
7     Serial.begin(115200);
8     delay(2000);
9     Serial.println("Setup start");
10    WiFi.begin(ssid_Router, password_Router);
11    Serial.println(String("Connecting to ") + ssid_Router);
12    while (WiFi.status() != WL_CONNECTED) {
13        delay(500);
14        Serial.print(".");
15    }
16    Serial.println("\nConnected, IP address: ");
17    Serial.println(WiFi.localIP());
18    Serial.println("Setup End");
19 }
20
21 void loop() {
22 }
```

Include the WiFi Library header file of ESP32.

```
1 #include <WiFi.h>
```

Enter correct router name and password.

```
3 const char *ssid_Router = "*****"; //Enter the router name
4 const char *password_Router = "*****"; //Enter the router password
```

Set ESP32 in Station mode and connect it to your router.

```
10 WiFi.begin(ssid_Router, password_Router);
```

Check whether ESP32 has connected to router successfully every 0.5s.

```
12 while (WiFi.status() != WL_CONNECTED) {
13     delay(500);
14     Serial.print(".");
15 }
```

Serial monitor prints out the IP address assigned to ESP32-WROVER

```
17 Serial.println(WiFi.localIP());
```

Reference

Class Station

Every time when using WiFi, you need to include header file "WiFi.h".

begin(ssid, password,channel, bssid, connect): ESP32 is used as Station to connect hotspot.

ssid: WiFi hotspot name

password: WiFi hotspot password

channel: WiFi hotspot channel number; communicating through specified channel; optional parameter

bssid: mac address of WiFi hotspot, optional parameter

connect: boolean optional parameter, defaulting to true. If set as false, then ESP32 won't connect WiFi.

config(local_ip, gateway, subnet, dns1, dns2): set static local IP address.

local_ip: station fixed IP address.

subnet: subnet mask

dns1,dns2: optional parameter. define IP address of domain name server

status: obtain the connection status of WiFi

local IP(): obtian IP address in Station mode

disconnect(): disconnect wifi

setAutoConnect(boolean): set automatic connection Every time ESP32 is power on, it will connect WiFi automatically.

setAutoReconnect(boolean): set automatic reconnection Every time ESP32 disconnects WiFi, it will reconnect to WiFi automatically.

Project 22.2 AP mode

Component List & Circuit

Component List & Circuit are the same as in Section 30.1.

Component knowledge

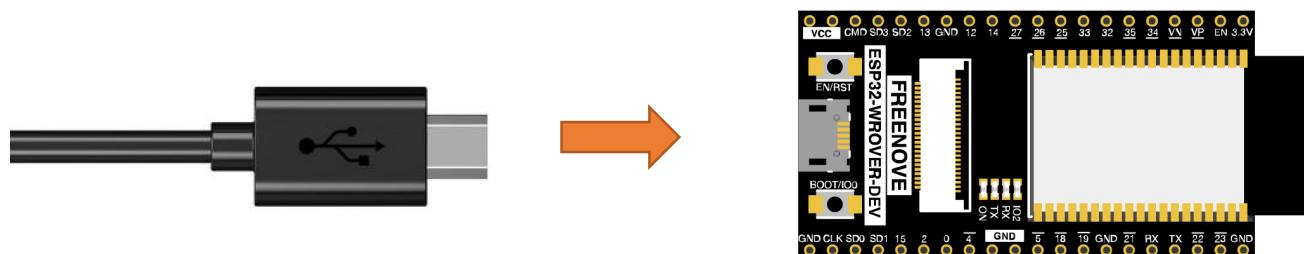

AP mode

When ESP32 selects AP mode, it creates a hotspot network that is separate from the Internet and waits for other WiFi devices to connect. As shown in the figure below, ESP32 is used as a hotspot. If a mobile phone or PC wants to communicate with ESP32, it must be connected to the hotspot of ESP32. Only after a connection is established with ESP32 can they communicate.

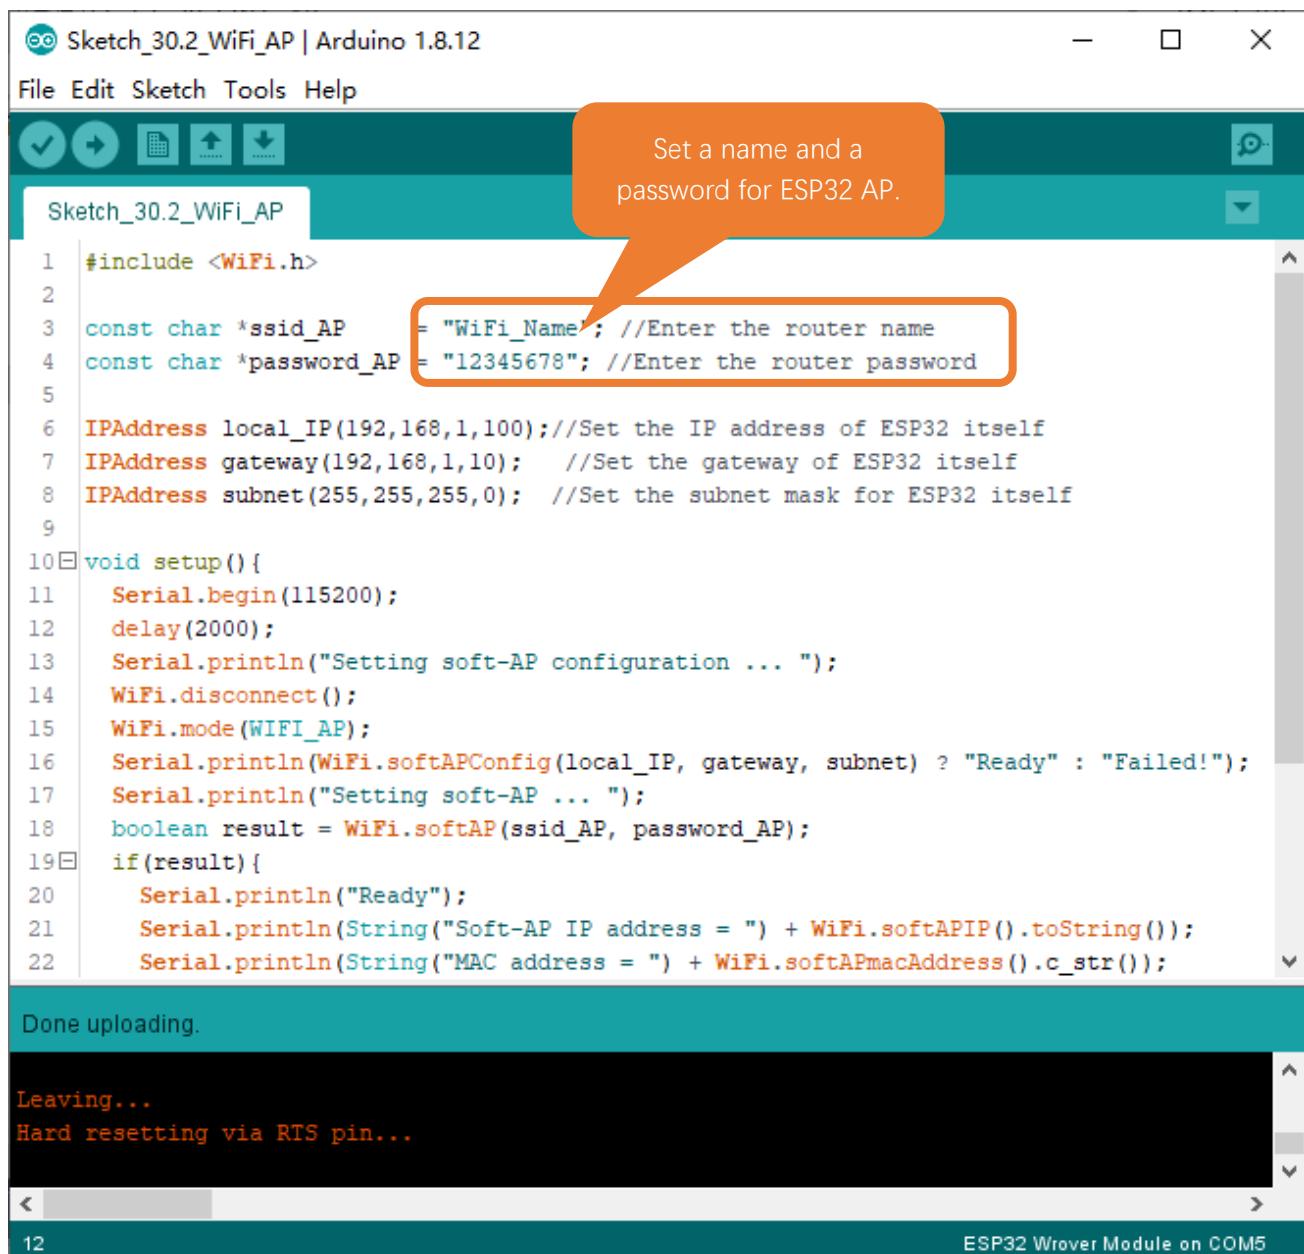

Circuit

Connect Freenove ESP32 to the computer using the USB cable.

Any concerns? ✉ support@freenove.com

Sketch

The screenshot shows the Arduino IDE interface with the sketch titled "Sketch_30.2_WiFi_AP". The code is as follows:

```
#include <WiFi.h>

const char *ssid_AP = "WiFi_Name"; //Enter the router name
const char *password_AP = "12345678"; //Enter the router password

IPAddress local_IP(192,168,1,100); //Set the IP address of ESP32 itself
IPAddress gateway(192,168,1,10); //Set the gateway of ESP32 itself
IPAddress subnet(255,255,255,0); //Set the subnet mask for ESP32 itself

void setup() {
    Serial.begin(115200);
    delay(2000);
    Serial.println("Setting soft-AP configuration ... ");
    WiFi.disconnect();
    WiFi.mode(WIFI_AP);
    Serial.println(WiFi.softAPConfig(local_IP, gateway, subnet) ? "Ready" : "Failed!");
    Serial.println("Setting soft-AP ... ");
    boolean result = WiFi.softAP(ssid_AP, password_AP);
    if(result){
        Serial.println("Ready");
        Serial.println(String("Soft-AP IP address = ") + WiFi.softAPIP().toString());
        Serial.println(String("MAC address = ") + WiFi.softAPmacAddress().c_str());
    }
}
```

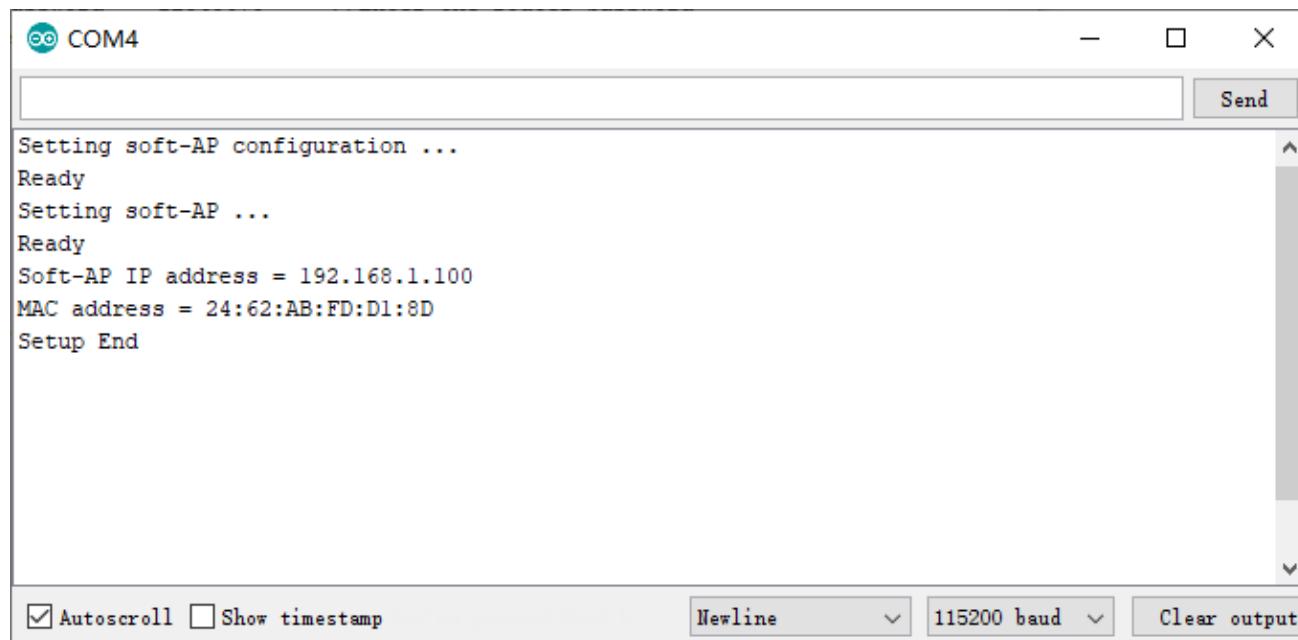

A callout bubble with the text "Set a name and a password for ESP32 AP." points to the line of code defining the AP SSID and password.

The serial monitor window shows the message "Done uploading." followed by "Leaving... Hard resetting via RTS pin...".

The status bar at the bottom right indicates "ESP32 Wrover Module on COM5".

Before the Sketch runs, you can make any changes to the AP name and password for ESP32 in the box as shown in the illustration above. Of course, you can leave it alone by default.

Compile and upload codes to ESP32-WROVER, open the serial monitor and set the baud rate to 115200. And then it will display as follows.

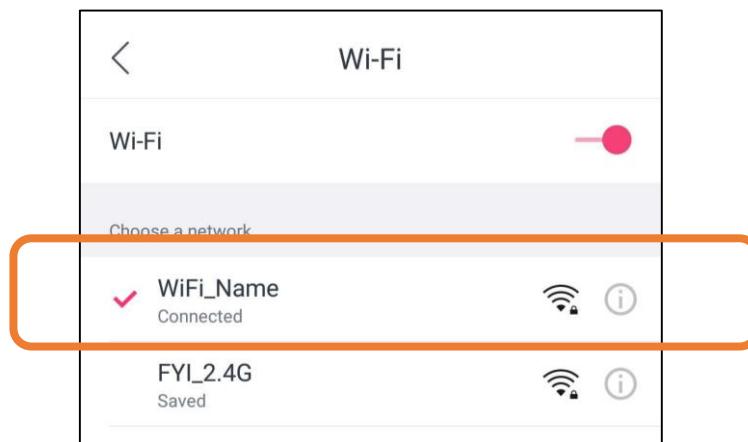

The screenshot shows a Windows-style serial monitor window titled "COM4". The text area contains the following output:

```
Setting soft-AP configuration ...
Ready
Setting soft-AP ...
Ready
Soft-AP IP address = 192.168.1.100
MAC address = 24:62:AB:FD:D1:8D
Setup End
```

At the bottom, there are several configuration options: "Autoscroll" (checked), "Show timestamp" (unchecked), "Newline" dropdown, "115200 baud" dropdown, and "Clear output" button.

When observing the print information of the serial monitor, turn on the WiFi scanning function of your phone, and you can see the ssid_AP on ESP32, which is called "WiFi_Name" in this Sketch. You can enter the password "12345678" to connect it or change its AP name and password by modifying Sketch.

Sketch_22.2_AP_mode

The following is the program code:

```

1 #include <WiFi.h>
2
3 const char *ssid_AP      = "WiFi_Name"; //Enter the router name
4 const char *password_AP = "12345678"; //Enter the router password
5
6 IPAddress local_IP(192, 168, 1, 100); //Set the IP address of ESP32 itself
7 IPAddress gateway(192, 168, 1, 10); //Set the gateway of ESP32 itself
8 IPAddress subnet(255, 255, 255, 0); //Set the subnet mask for ESP32 itself
9
10 void setup() {
11     Serial.begin(115200);
12     delay(2000);
13     Serial.println("Setting soft-AP configuration ... ");
14     WiFi.disconnect();
15     WiFi.mode(WIFI_AP);
16     Serial.println(WiFi.softAPConfig(local_IP, gateway, subnet) ? "Ready" : "Failed!");
17     Serial.println("Setting soft-AP ... ");
18     boolean result = WiFi.softAP(ssid_AP, password_AP);
19     if(result){
20         Serial.println("Ready");
21         Serial.println(String("Soft-AP IP address = ") + WiFi.softAPIP().toString());
22         Serial.println(String("MAC address = ") + WiFi.softAPmacAddress().c_str());
23     }else{
24         Serial.println("Failed!");
25     }
26     Serial.println("Setup End");
27 }
28
29 void loop() {
30 }
```

Include WiFi Library header file of ESP32.

```
1 #include <WiFi.h>
```

Enter correct AP name and password.

```

3 const char *ssid_AP      = "WiFi_Name"; //Enter the router name
4 const char *password_AP = "12345678"; //Enter the router password
```

Set ESP32 in AP mode.

```
15 WiFi.mode(WIFI_AP);
```

Configure IP address, gateway and subnet mask for ESP32.

```
16 WiFi.softAPConfig(local_IP, gateway, subnet)
```

Turn on an AP in ESP32, whose name is set by ssid_AP and password is set by password_AP.

```
18 WiFi.softAP(ssid_AP, password_AP);
```

Check whether the AP is turned on successfully. If yes, print out IP and MAC address of AP established by ESP32. If no, print out the failure prompt.

```
19 if(result){  
20     Serial.println("Ready");  
21     Serial.println(String("Soft-AP IP address = ") + WiFi.softAPIP().toString());  
22     Serial.println(String("MAC address = ") + WiFi.softAPmacAddress().c_str());  
23 }else{  
24     Serial.println("Failed!");  
25 }  
26 Serial.println("Setup End");
```

Reference

Class AP

Every time when using WiFi, you need to include header file "WiFi.h".

softAP(ssid, password, channel, ssid_hidden, max_connection):

ssid: WiFi hotspot name

password: WiFi hotspot password

channel: Number of WiFi connection channels, range 1-13. The default is 1.

ssid_hidden: Whether to hide WiFi name from scanning by other devices. The default is not hide.

max_connection: Maximum number of WiFi connected devices. The range is 1-4. The default is 4.

softAPConfig(local_ip, gateway, subnet): set static local IP address.

local_ip: station fixed IP address.

Gateway: gateway IP address

subnet: subnet mask

softAP(): obtain IP address in AP mode

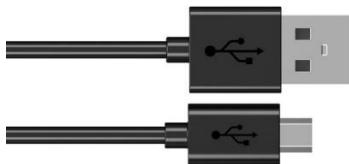

softAPdisconnect (): disconnect AP mode.

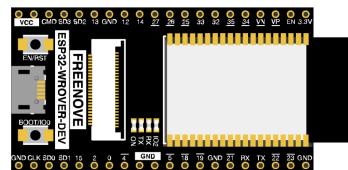

Project 22.3 AP+Station mode

Component List

Micro USB Wire x1

ESP32-WROVER x1

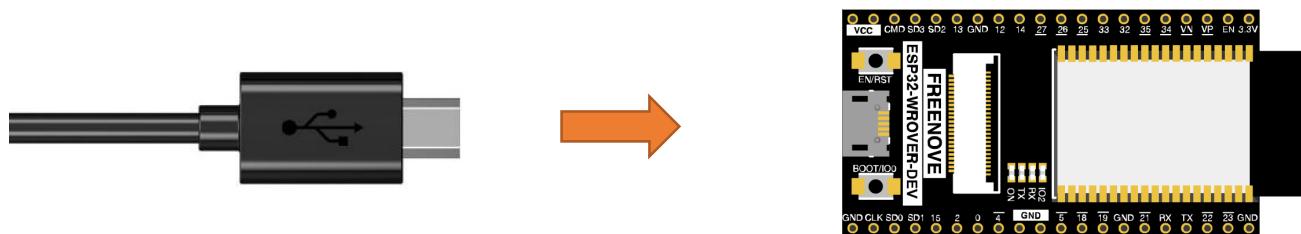

Component knowledge

AP+Station mode

In addition to AP mode and station mode, ESP32 can also use AP mode and station mode at the same time. This mode contains the functions of the previous two modes. Turn on ESP32's station mode, connect it to the router network, and it can communicate with the Internet via the router. At the same time, turn on its AP mode to create a hotspot network. Other WiFi devices can choose to connect to the router network or the hotspot network to communicate with ESP32.

Circuit

Connect Freenove ESP32 to the computer using the USB cable.

Sketch

Sketch_22.3_AP_Station_mode

Please enter the correct names and passwords of Router and AP.

```

7 #include <WiFi.h>
8
9 const char *ssid_Router = "*****"; //Enter the router name
10 const char *password_Route = "*****"; //Enter the router password
11 const char *ssid_AP = "WiFi_Name"; //Enter the AP name
12 const char *password_AP = "12345678"; //Enter the AP password
13
14 void setup(){
15     Serial.begin(115200);
16     Serial.println("Setting soft-AP configuration ... ");
17     WiFi.disconnect();
18     WiFi.mode(WIFI_AP);
19     Serial.println("Setting soft-AP ... ");
20     boolean result = WiFi.softAP(ssid_AP, password_AP);
21     if(result){
22         Serial.println("Ready");
23         Serial.println(String("Soft-AP IP address = ") + WiFi.softAPIP().toString());
24         Serial.println(String("MAC address = ") + WiFi.softAPmacAddress().c_str());
25     }else{
26         Serial.println("Failed!");
27     }
}

```

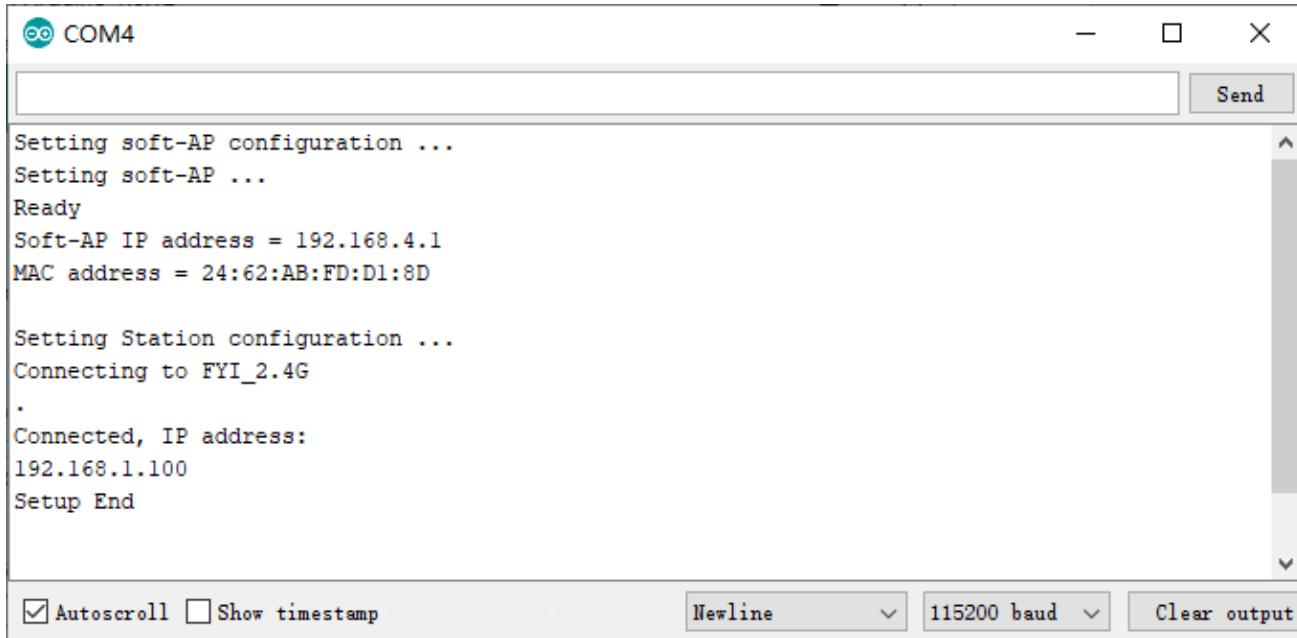

Done uploading.

Leaving...
Hard resetting via RTS pin...

It is analogous to Project 22.1 and Project 22.2. Before running the Sketch, you need to modify ssid_Router, password_Router, ssid_AP and password_AP shown in the box of the illustration above.

Any concerns? ✉ support@freenove.com

After making sure that Sketch is modified correctly, compile and upload codes to ESP32-WROVER, open serial monitor and set baud rate to 115200. And then it will display as follows:

The screenshot shows the Arduino Serial Monitor window titled "COM4". The text output is as follows:

```

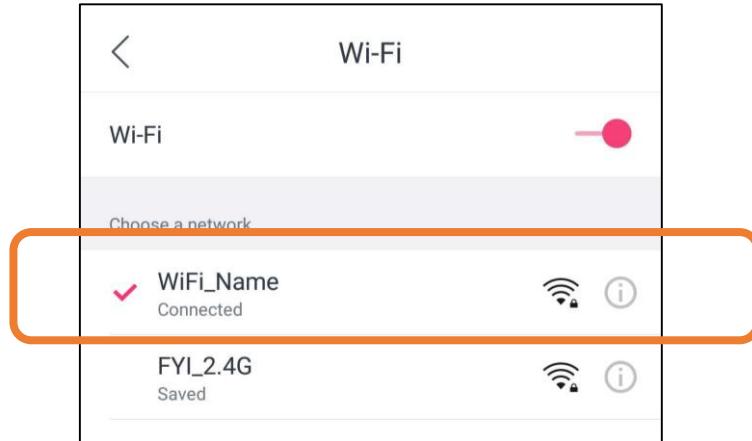

Setting soft-AP configuration ...
Setting soft-AP ...
Ready
Soft-AP IP address = 192.168.4.1
MAC address = 24:62:AB:FD:D1:8D

Setting Station configuration ...
Connecting to FYI_2.4G
.
Connected, IP address:
192.168.1.100
Setup End

```

At the bottom, there are checkboxes for "Autoscroll" and "Show timestamp", and buttons for "Newline", "115200 baud", and "Clear output".

When observing the print information of the serial monitor, turn on the WiFi scanning function of your phone, and you can see the ssid_AP on ESP32.

The following is the program code:

```

1 #include <WiFi.h>
2
3 const char *ssid_Router      = "*****"; //Enter the router name
4 const char *password_Router = "*****"; //Enter the router password
5 const char *ssid_AP         = "WiFi_Name"; //Enter the AP name
6 const char *password_AP     = "12345678"; //Enter the AP password
7
8 void setup() {
9   Serial.begin(115200);
10  Serial.println("Setting soft-AP configuration ... ");
11  WiFi.disconnect();

```

```
12 WiFi.mode(WIFI_AP);
13 Serial.println("Setting soft-AP ... ");
14 boolean result = WiFi.softAP(ssid_AP, password_AP);
15 if(result){
16     Serial.println("Ready");
17     Serial.println(String("Soft-AP IP address = ") + WiFi.softAPIP().toString());
18     Serial.println(String("MAC address = ") + WiFi.softAPmacAddress().c_str());
19 }else{
20     Serial.println("Failed!");
21 }
22
23 Serial.println("\nSetting Station configuration ... ");
24 WiFi.begin(ssid_Router, password_Router);
25 Serial.println(String("Connecting to ") + ssid_Router);
26 while (WiFi.status() != WL_CONNECTED) {
27     delay(500);
28     Serial.print(".");
29 }
30 Serial.println("\nConnected, IP address: ");
31 Serial.println(WiFi.localIP());
32 Serial.println("Setup End");
33 }
34
35 void loop() {
36 }
```

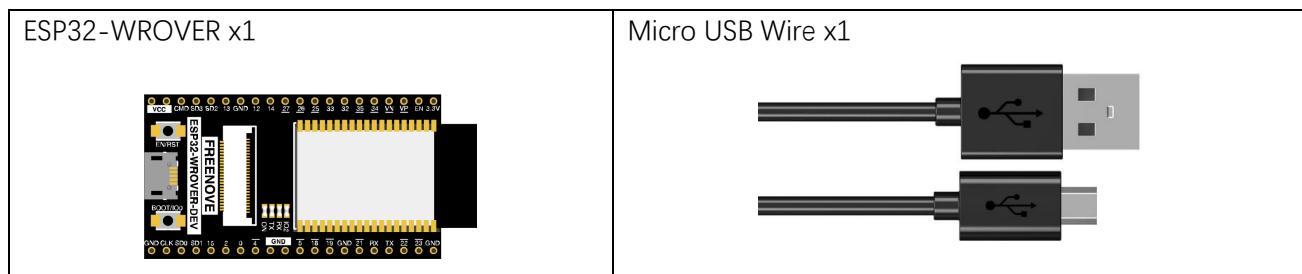

Chapter 23 TCP/IP

In this chapter, we will introduce how ESP32 implements network communications based on TCP/IP protocol. There are two roles in TCP/IP communication, namely Server and Client, which will be implemented respectively with two projects in this chapter.

Project 23.1 As Client

In this section, ESP32 is used as Client to connect Server on the same LAN and communicate with it.

Component List

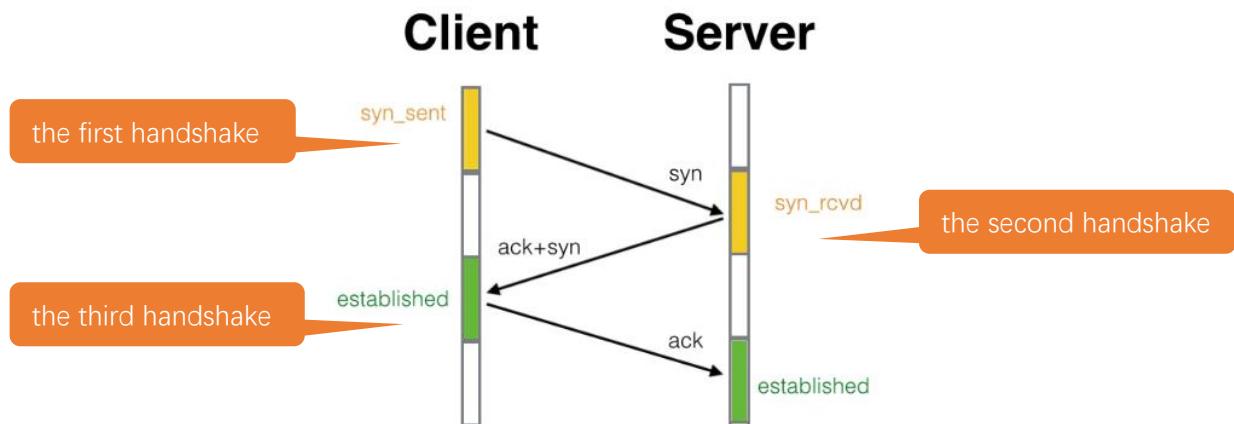

Component knowledge

TCP connection

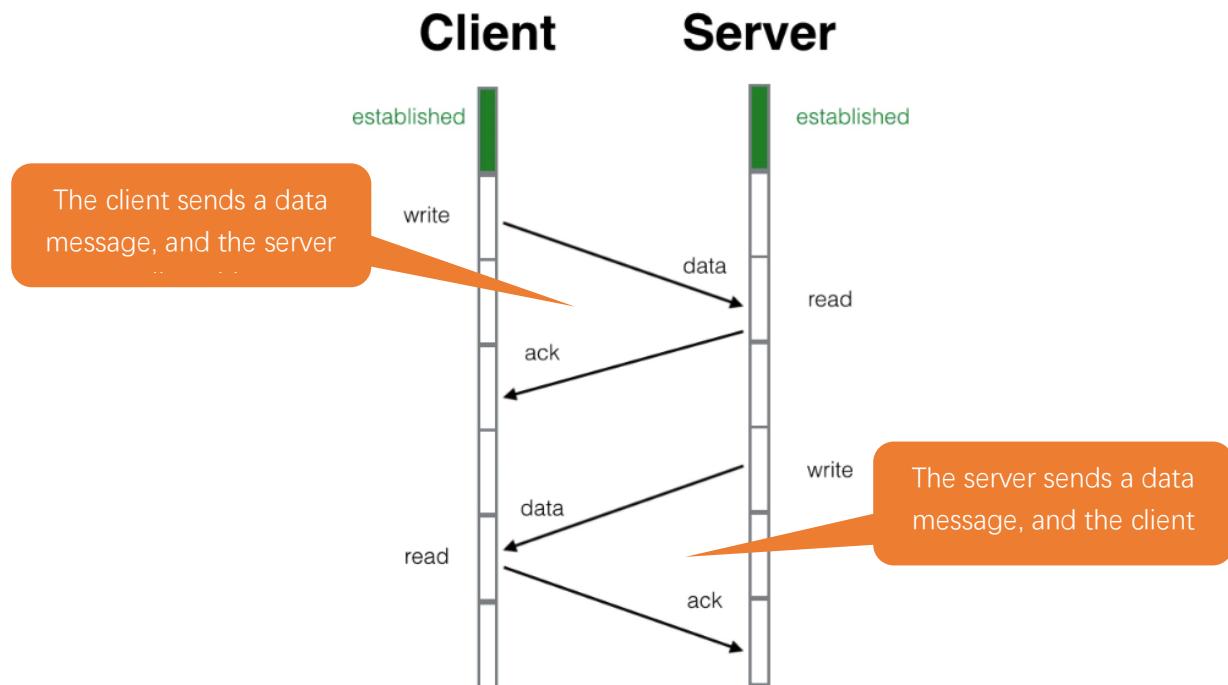

Before transmitting data, TCP needs to establish a logical connection between the sending end and the receiving end. It provides reliable and error-free data transmission between the two computers. In the TCP connection, the client and the server must be clarified. The client sends a connection request to the server, and each time such a request is proposed, a "three-times handshake" is required.

Three-times handshake: In the TCP protocol, during the preparation phase of sending data, the client and the server interact three times to ensure the reliability of the connection, which is called "three-times handshake". The first handshake, the client sends a connection request to the server and waits for the server to confirm. The second handshake, the server sends a response back to the client informing that it has received the connection request.

The third handshake, the client sends a confirmation message to the server again to confirm the connection.

TCP is a connection-oriented, low-level transmission control protocol. After TCP establishes a connection, the client and server can send and receive messages to each other, and the connection will always exist as long as the client or server does not initiate disconnection. Each time one party sends a message, the other party will reply with an ack signal.

Install Processing

In this tutorial, we use Processing to build a simple TCP/IP communication platform.

If you've not installed Processing, you can download it by clicking <https://processing.org/download/>. You can choose an appropriate version to download according to your PC system.

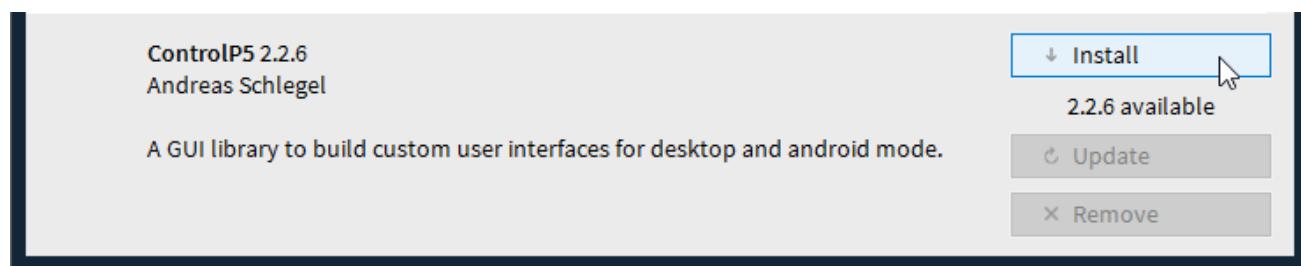

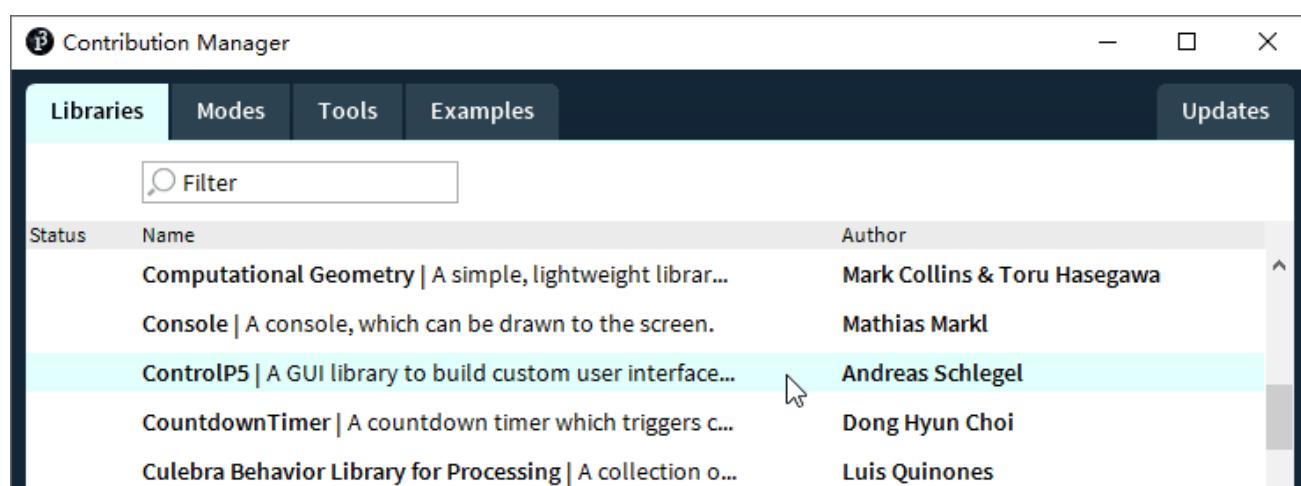

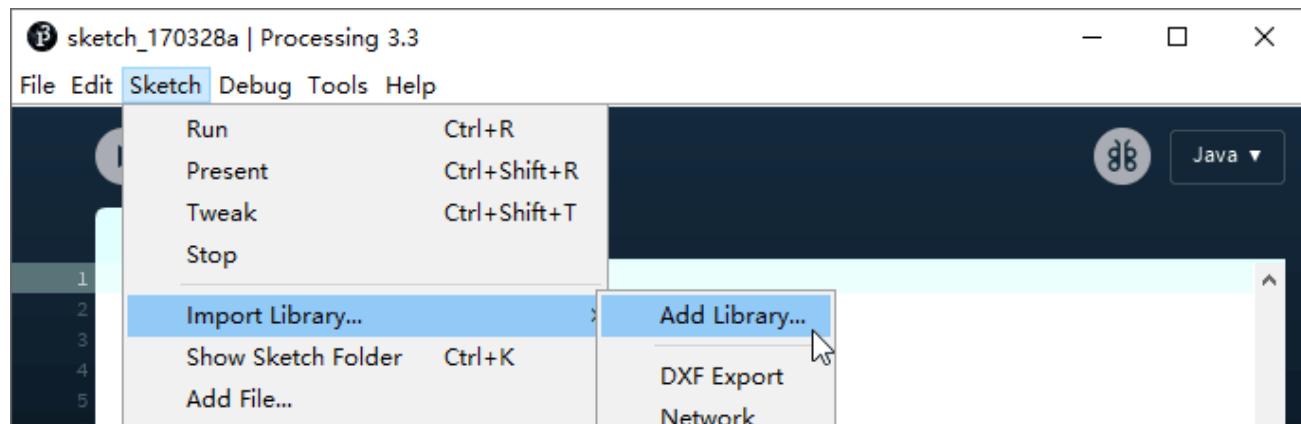

The screenshot shows the official Processing website's download section. At the top, there are navigation links for "Processing", "p5.js", "Processing.py", "Processing for Android", "Processing for Pi", and "Processing Foundation". A search bar is located in the top right. The main content area features a large "Processing" logo on the left and a central text block that reads: "Download Processing. Processing is available for Linux, Mac OS X, and Windows. Select your choice to download the software below." Below this text, there is a large circular logo with a stylized "P" inside. To the right of the logo, the version "3.5.4 (17 January 2020)" is listed, followed by download links for "Windows 64-bit", "Windows 32-bit", "Linux 64-bit", and "Mac OS X". On the left side of the page, there is a sidebar with various links: "Cover", "Download", "Donate", "Exhibition", "Reference", "Libraries", "Tools", "Environment", "Tutorials", "Examples", "Books", "Overview", and "People". Under the "Tutorials" link, there are additional links: "» Github", "» Report Bugs", "» Wiki", "» Supported Platforms", and "Read about the [changes in 3.0](#). The list of revisions covers the differences between releases in detail."

Unzip the downloaded file to your computer. Click "processing.exe" as the figure below to run this software.

Use Server mode for communication

Install ControlP5.

Open the “**Freenove_Super_Starter_Kit_for_ESP32\Sketches\Sketches\Sketch_23.1_WiFiClient\sketchWiFi\sketchWiFi.pde**”, and click “Run”.

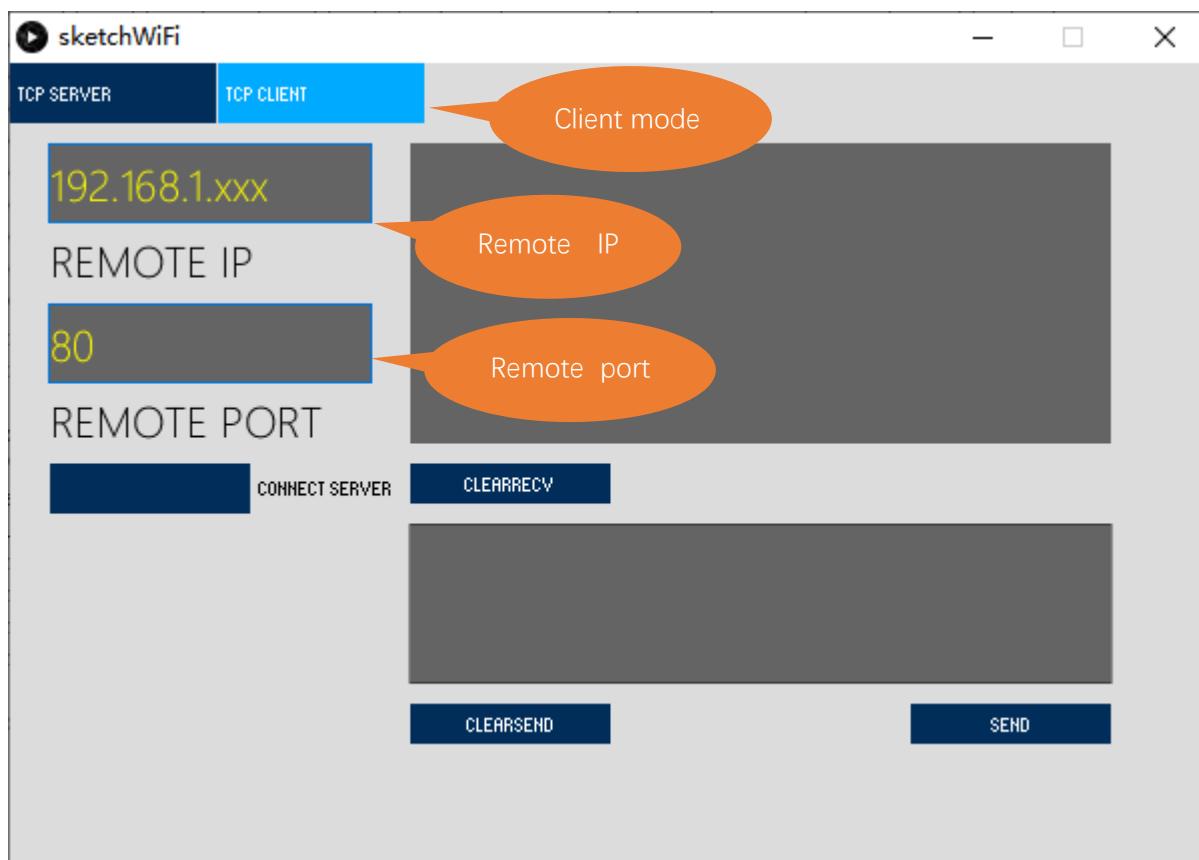

The new pop-up interface is as follows. If ESP32 is used as client, select TCP SERVER mode for sketchWiFi.

When sketchWiFi selects TCP SERVER mode, ESP32 Sketch needs to be changed according to sketchWiFi's displaying of LOCAL IP or LOCAL PORT.

If ESP32 serves as server, select TCP CLIENT mode for sketchWiFi.

When sketchWiFi selects TCP CLIENT mode, the LOCAL IP and LOCAL PORT of sketchWiFi need to be changed according to the IP address and port number printed by the serial monitor.

Mode selection: select **Server mode/Client mode**.

IP address: In server mode, this option does not need to be filled in, and the computer will automatically obtain the IP address.

In client mode, fill in the remote IP address to be connected.

Port number: In server mode, fill in a port number for client devices to make an access connection.

In client mode, fill in port number given by the Server devices to make an access connection.

Start button: In server mode, push the button, then the computer will serve as server and open a port number for client to make access connection. During this period, the computer will keep monitoring.

In client mode, before pushing the button, please make sure the server is on, remote IP address and remote port number is correct; push the button, and the computer will make access connection to the remote port number of the remote IP as a client.

clear receive: clear out the content in the receiving text box

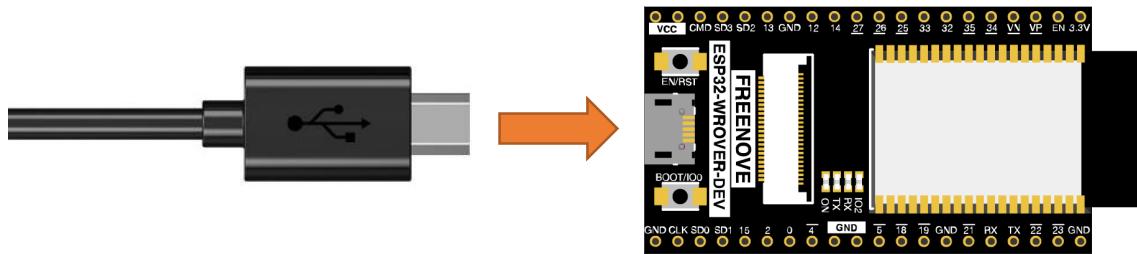

clear send: clear out the content in the sending text box

Sending button: push the sending button, the computer will send the content in the text box to others.

Circuit

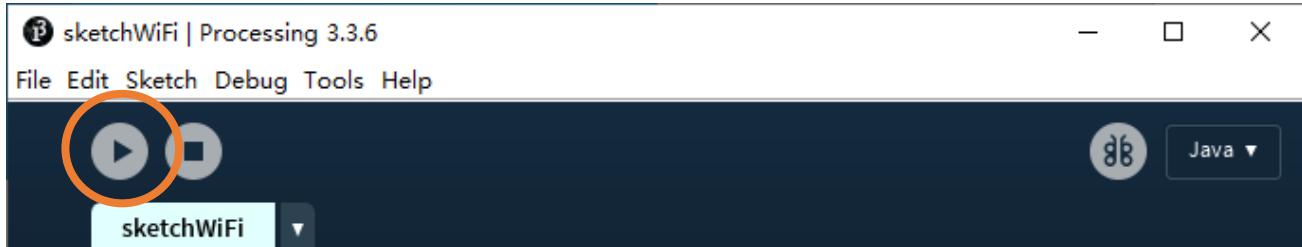

Connect Freenove ESP32 to the computer using USB cable.

Any concerns? [✉ support@freenove.com](mailto:support@freenove.com)

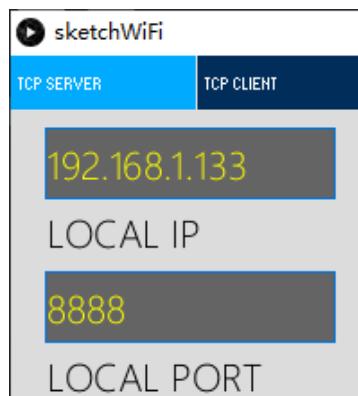

Sketch

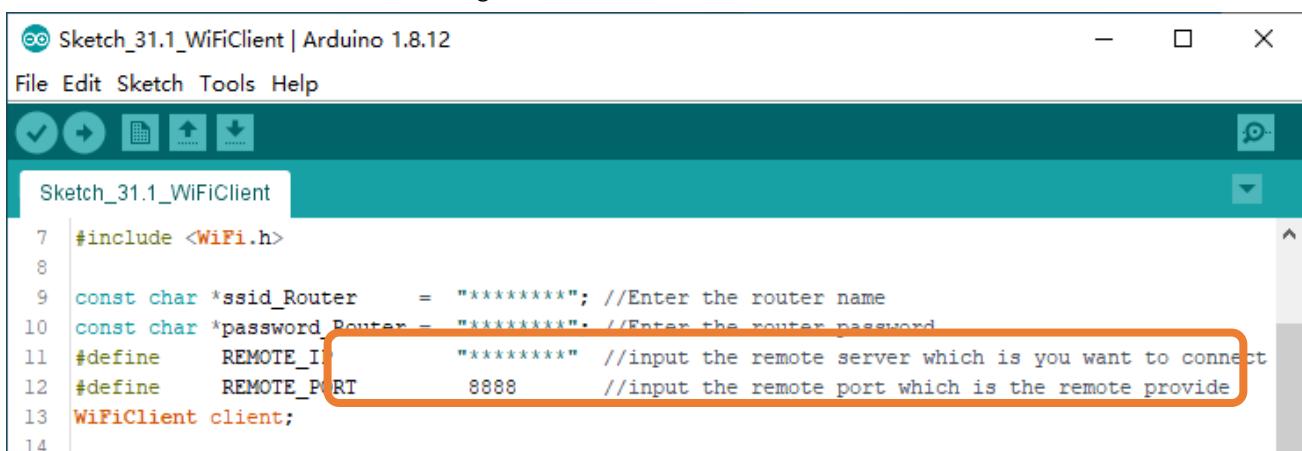

Before running the Sketch, please open "sketchWiFi.pde." first, and click "Run".

The newly pop up window will use the computer's IP address by default and open a data monitor port.

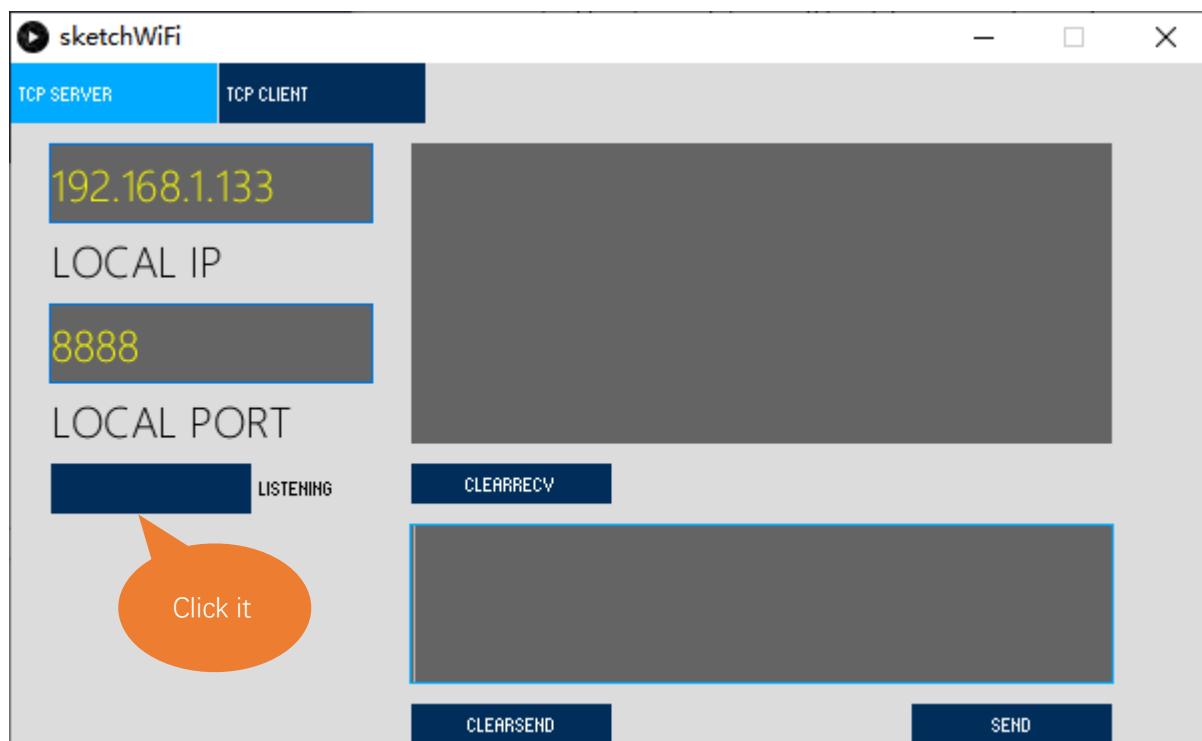

Next, open Sketch_23.1_WiFiClient.ino. Before running it, please change the following information based on "LOCAL IP" and "LOCAL PORT" in the figure above.

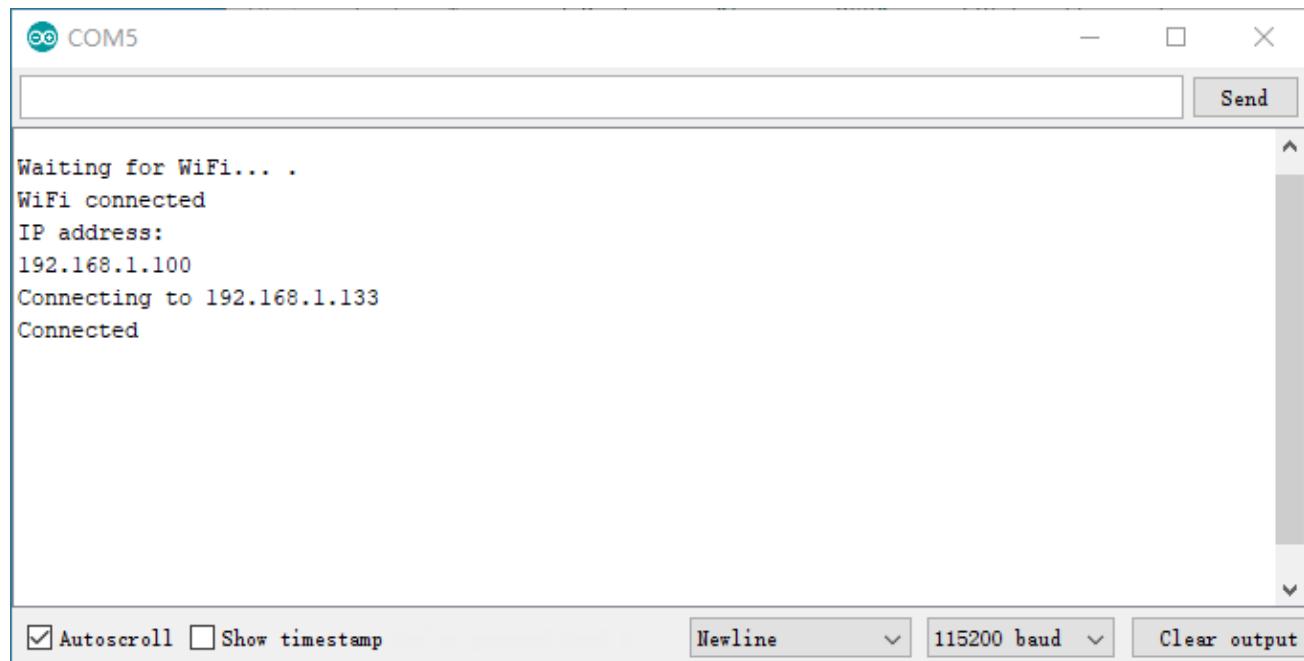

REMOTE_IP needs to be filled in according to the interface of sketchWiFi.pde. Taking this tutorial as an example, its REMOTE_IP is "192.168.1.133". Generally, by default, the ports do not need to change its value.

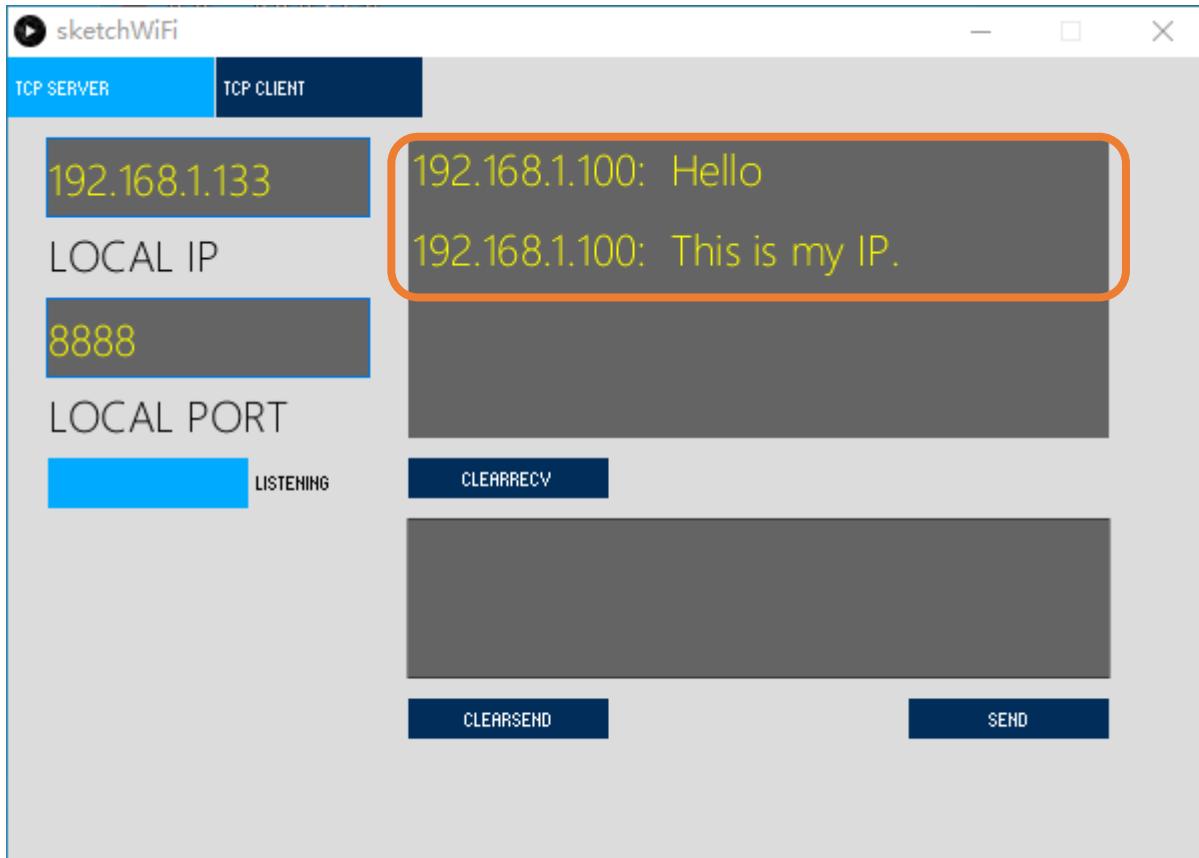

Click LISTENING, turn on TCP SERVER's data listening function and wait for ESP32 to connect.

Compile and upload code to ESP32-WROVER, open the serial monitor and set the baud rate to 115200. ESP32 connects router, obtains IP address and sends access request to server IP address on the same LAN till the connection is successful. When connect successfully, ESP32 can send messages to server.

ESP32 connects with TCP SERVER, and TCP SERVER receives messages from ESP32, as shown in the figure below.

Sketch_23.1_As Client

The following is the program code:

```
1 #include <WiFi.h>
2
3 const char *ssid_Router      = "*****"; //Enter the router name
4 const char *password_Router = "*****"; //Enter the router password
5 #define    REMOTE_IP        "*****"   //input the remote server which is you want to connect
6 #define    REMOTE_PORT       8888      //input the remote port which is the remote provide
7 WiFiClient client;
8
9 void setup() {
10     Serial.begin(115200);
11     delay(10);
12
13     WiFi.begin(ssid_Router, password_Router);
14     Serial.print("\nWaiting for WiFi... ");
15     while (WiFi.status() != WL_CONNECTED) {
16         Serial.print(".");
17         delay(500);
18     }
19     Serial.println("");
20     Serial.println("WiFi connected");
21     Serial.println("IP address: ");
22     Serial.println(WiFi.localIP());
23     delay(500);
24
25     Serial.print("Connecting to ");
26     Serial.println(REMOTE_IP);
27
28     while (!client.connect(REMOTE_IP, REMOTE_PORT)) {
29         Serial.println("Connection failed.");
30         Serial.println("Waiting a moment before retrying... ");
31     }
32     Serial.println("Connected");
33     client.print("Hello\n");
34     client.print("This is my IP.\n");
35
36 void loop() {
37     if (client.available() > 0) {
38         delay(20);
39         //read back one line from the server
40         String line = client.readString();
41         Serial.println(REMOTE_IP + String(":") + line);
```

```

42 }
43 if (Serial.available() > 0) {
44     delay(20);
45     String line = Serial.readString();
46     client.print(line);
47 }
48 if (client.connected () == 0) {
49     client.stop();
50     WiFi.disconnect();
51 }
52 }
```

Add WiFi function header file.

```
1 #include <WiFi.h>
```

Enter the actual router name, password, remote server IP address, and port number.

```

3 const char *ssid_Router      = "*****"; //Enter the router name
4 const char *password_Router = "*****"; //Enter the router password
5 #define    REMOTE_IP        "*****"   //input the remote server which is you want to connect
6 #define    REMOTE_PORT       8888      //input the remote port which is the remote provide
```

Apply for the method class of WiFiClient.

```
7 WiFiClient client;
```

Connect specified WiFi until it is successful. If the name and password of WiFi are correct but it still fails to connect, please push the reset key.

```

13 WiFi.begin(ssid_Router, password_Router);
14 Serial.print("\nWaiting for WiFi... ");
15 while (WiFi.status() != WL_CONNECTED) {
16     Serial.print(".");
17     delay(500);
18 }
```

Send connection request to remote server until connect successfully. When connect successfully, print out the connecting prompt on the serial monitor and send messages to remote server.

```

28 while (!client.connect(REMOTE_IP, REMOTE_PORT)) { //Connect to Server
29     Serial.println("Connection failed.");
30     Serial.println("Waiting a moment before retrying... ");
31 }
32 Serial.println("Connected");
33 client.print("Hello\n");
```

When ESP32 receive messages from servers, it will print them out via serial port; Users can also send messages to servers from serial port.

```

37 if (client.available() > 0) {
38     delay(20);
39     //read back one line from the server
40     String line = client.readString();
41     Serial.println(REMOTE_IP + String(":") + line);
42 }
```

```
43 if (Serial.available() > 0) {  
44     delay(20);  
45     String line = Serial.readString();  
46     client.print(line);  
47 }
```

If the server is disconnected, turn off WiFi of ESP32.

```
48 if (client.connected () == false) {  
49     client.stop();  
50     WiFi.disconnect();  
51 }
```

Reference

Class Client

Every time when using Client, you need to include header file "WiFi.h."

connect(ip, port, timeout)/connect(*host, port, timeout): establish a TCP connection.

ip, *host: ip address of target server

port: port number of target server

timeout: connection timeout

connected(): judge whether client is connecting. If return value is 1, then connect successfully; If return value is 0, then fail to connect.

stop(): stop tcp connection

print(): send data to server connecting to client

available(): return to the number of bytes readable in receive buffer, if no, return to 0 or -1.

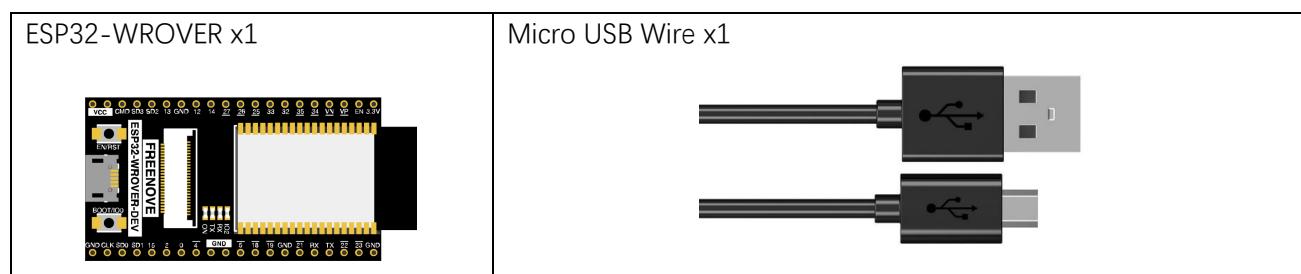

read(): read one byte of data in receive buffer

readString(): read string in receive buffer

Project 23.2 As Server

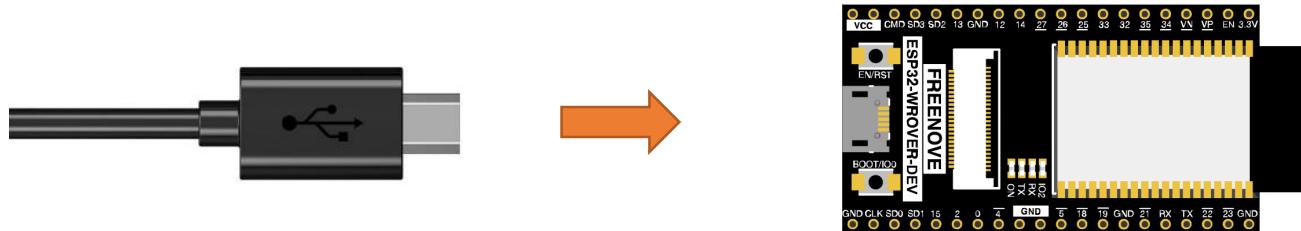

In this section, ESP32 is used as a server to wait for the connection and communication of client on the same LAN.

Component List

Circuit

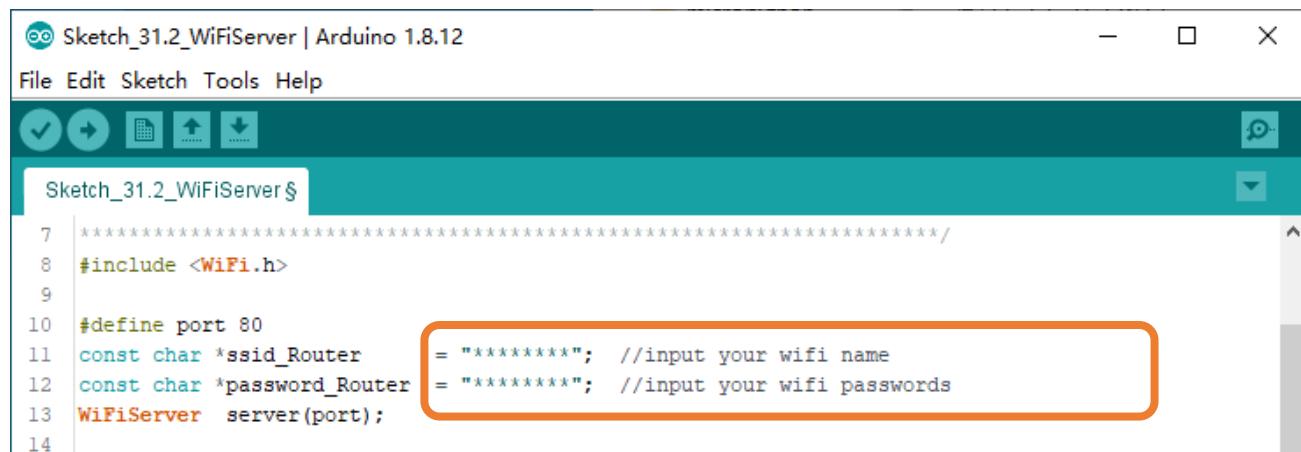

Connect Freenove ESP32 to the computer using a USB cable.

Sketch

Before running Sketch, please modify the contents of the box below first.

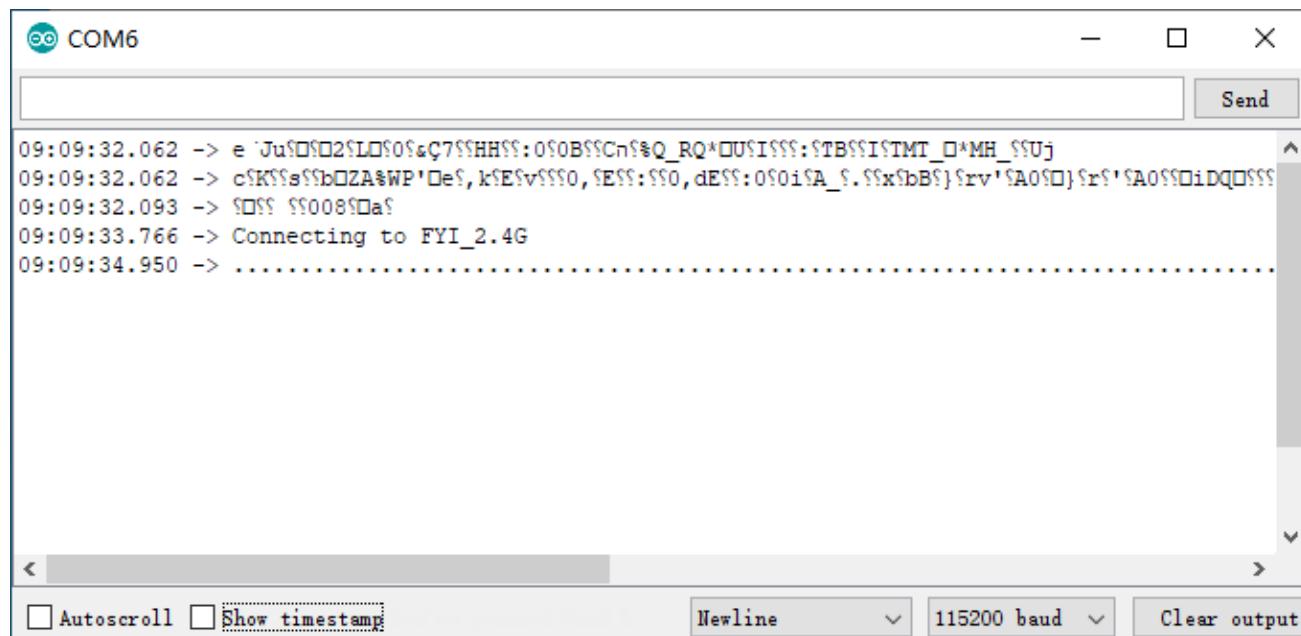

Sketch_23.2_As_Server

```
Sketch_31.2_WiFiServer | Arduino 1.8.12
File Edit Sketch Tools Help
Sketch_31.2_WiFiServer §
7 ****
8 #include <WiFi.h>
9
10 #define port 80
11 const char *ssid_Router
12 const char *password_Router
13 WiFiServer server(port);
14
```

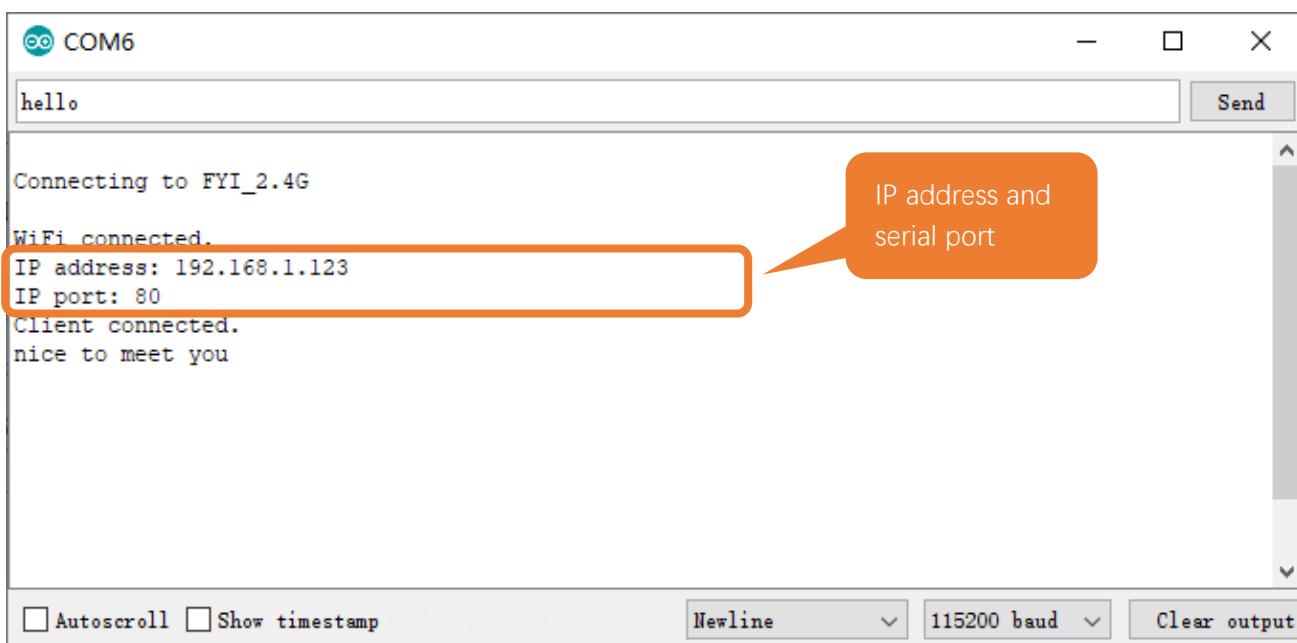

Compile and upload code to ESP32-WROVER board, open the serial monitor and set the baud rate to 115200. Turn on server mode for ESP32, waiting for the connection of other devices on the same LAN. Once a device connects to server successfully, they can send messages to each other.

If the ESP32 fails to connect to router, press the reset button as shown below and wait for ESP32 to run again.

```
09:09:32.062 -> e 'Ju{O{2{L{0{e{7{HH{0:0{0B{{Ch{{Q_RQ*0{0I{{:0TB{{TMT_{{MH_{{U{j

```

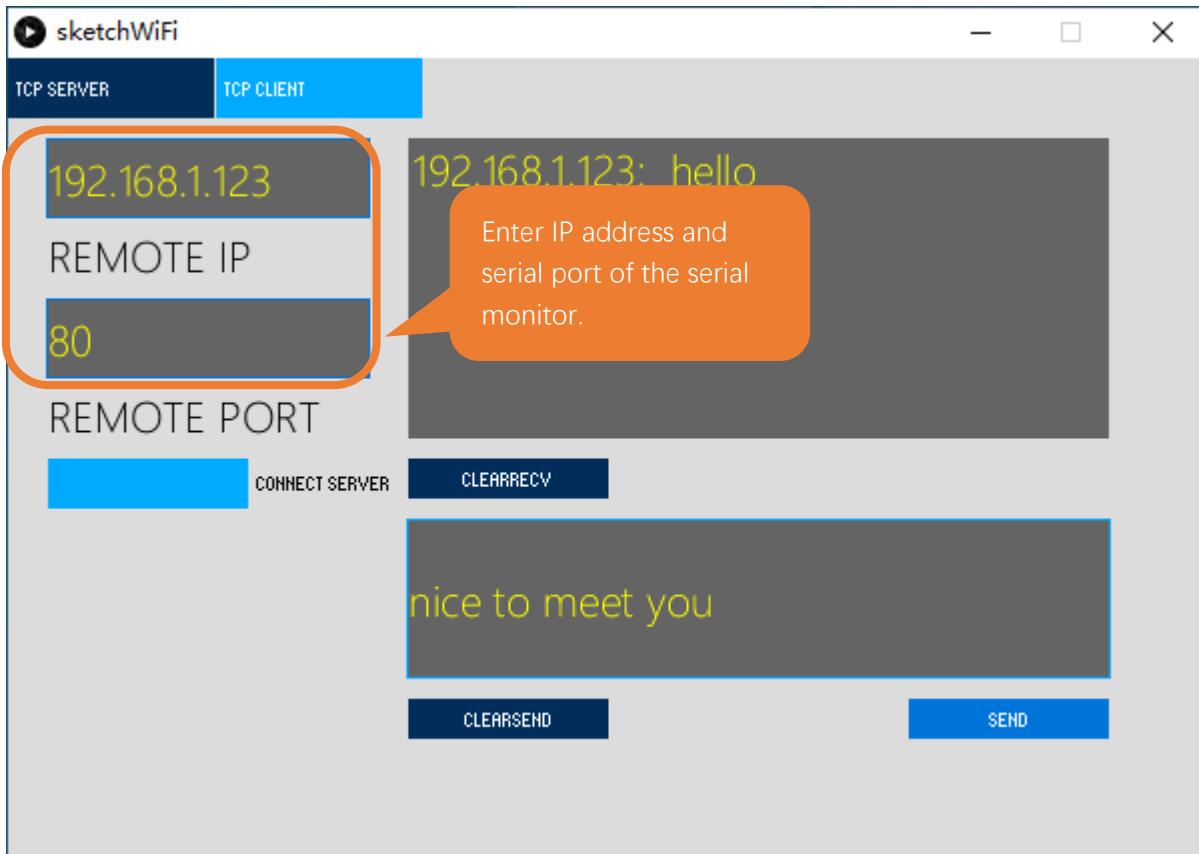

Serial Monitor

Processing:

Open the "Freenove_Super_Starter_Kit_for_ESP32\Sketches\Sketches\Sketch_23.2_WiFiServer\sketchWiFi\sketchWiFi.pde".

Based on the messages printed by the serial monitor, enter correct IP address and serial port in Processing to establish connection and make communication.

The following is the program code:

```
1 #include <WiFi.h>
2
3 #define port 80
4 const char *ssid_Router      = "*****"; //input your wifi name
5 const char *password_Router = "*****"; //input your wifi passwords
6 WiFiServer server(port);
7
8 void setup()
9 {
10    Serial.begin(115200);
11    Serial.printf("\nConnecting to ");
12    Serial.println(ssid_Router);
13    WiFi.disconnect();
14    WiFi.begin(ssid_Router, password_Router);
15    delay(1000);
16    while (WiFi.status() != WL_CONNECTED) {
17        delay(500);
18        Serial.print(".");
19    }
20    Serial.println("");
21    Serial.println("WiFi connected.");
22    Serial.print("IP address: ");
23    Serial.println(WiFi.localIP());
24    Serial.printf("IP port: %d\n", port);
25    server.begin(port);
26    WiFi.setAutoConnect(true);
27    WiFi.setAutoReconnect(true);
28 }
29
30 void loop() {
31    WiFiClient client = server.available();           // listen for incoming clients
32    if (client) {                                     // if you get a client
33        Serial.println("Client connected.");
34        while (client.connected()) {                  // loop while the client's connected
35            if (client.available()) {                // if there's bytes to read from the
36                Serial.println(client.readStringUntil('\n'));// print it out the serial monitor
37                while(client.read()>0);                 // clear the wifi receive area cache
38            }
39            if(Serial.available()){                   // if there's bytes to read from the
36 serial monitor
37                client.print(Serial.readStringUntil('\n'));// print it out the client.
38                while(Serial.read()>0);                  // clear the wifi receive area cache
39            }
40        }
41    }
42 }
```

Any concerns? ✉ support@freenove.com

```

42     }
43   }
44   client.stop();           // stop the client connecting.
45   Serial.println("Client Disconnected.");
46 }
47 }
```

Apply for method class of WiFiServer.

6	<code>WiFiServer server(port);</code> //Apply for a Server object whose port number is 80
---	---

Connect specified WiFi until it is successful. If the name and password of WiFi are correct but it still fails to connect, please push the reset key.

```

13   WiFi.disconnect();
14   WiFi.begin(ssid_Router, password_Router);
15   delay(1000);
16   while (WiFi.status() != WL_CONNECTED) {
17     delay(500);
18     Serial.print(".");
19   }
20   Serial.println("");
21   Serial.println("WiFi connected.");
```

Print out the IP address and port number of ESP32.

22	<code>Serial.print("IP address: ");</code>	
23	<code>Serial.println(WiFi.localIP());</code>	//print out IP address of ESP32
24	<code>Serial.printf("IP port: %d\n", port);</code>	//Print out ESP32's port number

Turn on server mode of ESP32, start automatic connection and turn on automatic reconnection.

25	<code>server.begin();</code>	//Turn ON ESP32 as Server mode
26	<code>WiFi.setAutoConnect(true);</code>	
27	<code>WiFi.setAutoReconnect(true);</code>	

When ESP32 receive messages from servers, it will print them out via serial port; Users can also send messages to servers from serial port.

35	<code>if (client.available()) {</code>	// if there's bytes to read from the
36	<code> client</code>	
37	<code> Serial.println(client.readStringUntil('\n'));</code>	// print it out the serial monitor
38	<code> while(client.read()>0);</code>	// clear the wifi receive area cache
39	<code>}</code>	
40	<code>if(Serial.available()){</code>	// if there's bytes to read from the
41	<code> serial monitor</code>	
42	<code> client.print(Serial.readStringUntil('\n'));</code>	// print it out the client.
	<code> while(Serial.read()>0);</code>	// clear the wifi receive area cache
	<code>}</code>	

Reference

Class Server

Every time use Server functionality, we need to include header file "WiFi.h".

WiFiServer(uint16_t port=80, uint8_t max_clients=4): create a TCP Server.

port: ports of Server; range from 0 to 65535 with the default number as 80.

max_clients: maximum number of clients with default number as 4.

begin(port): start the TCP Server.

port: ports of Server; range from 0 to 65535 with the default number as 0.

setNoDelay(bool nodelay): whether to turn off the delay sending functionality.

nodelay: true stands for forbidden Nagle algorithm.

close(): close tcp connection.

stop(): stop tcp connection.

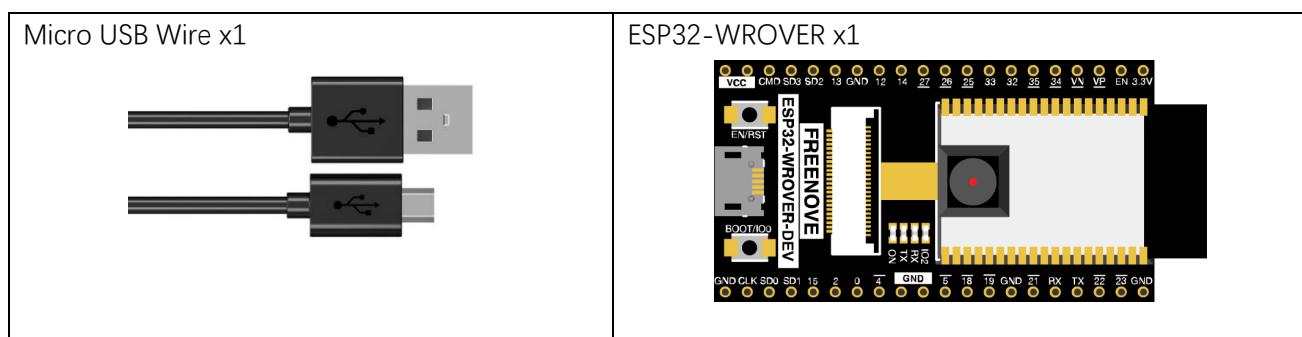

Chapter 24 Camera Web Server

In this section, we'll use ESP32's video function as an example to study.

Project 24.1 Camera Web Server

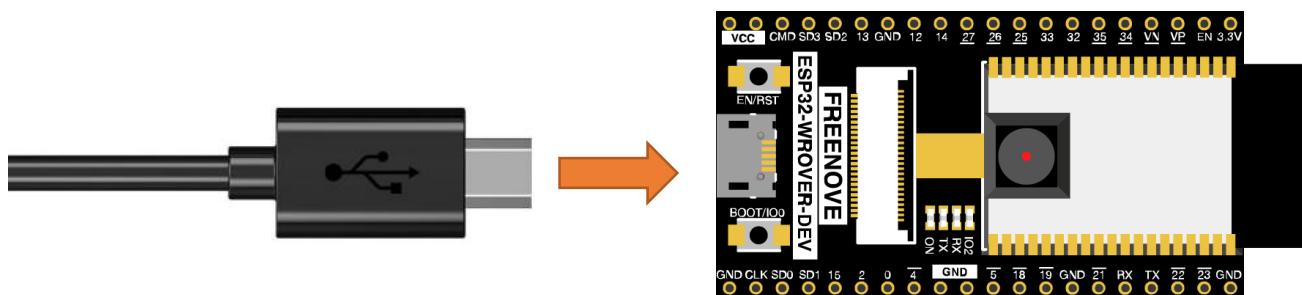

Connect ESP32 using USB and check its IP address through serial monitor. Use web page to access IP address to obtain video and image data.

Component List

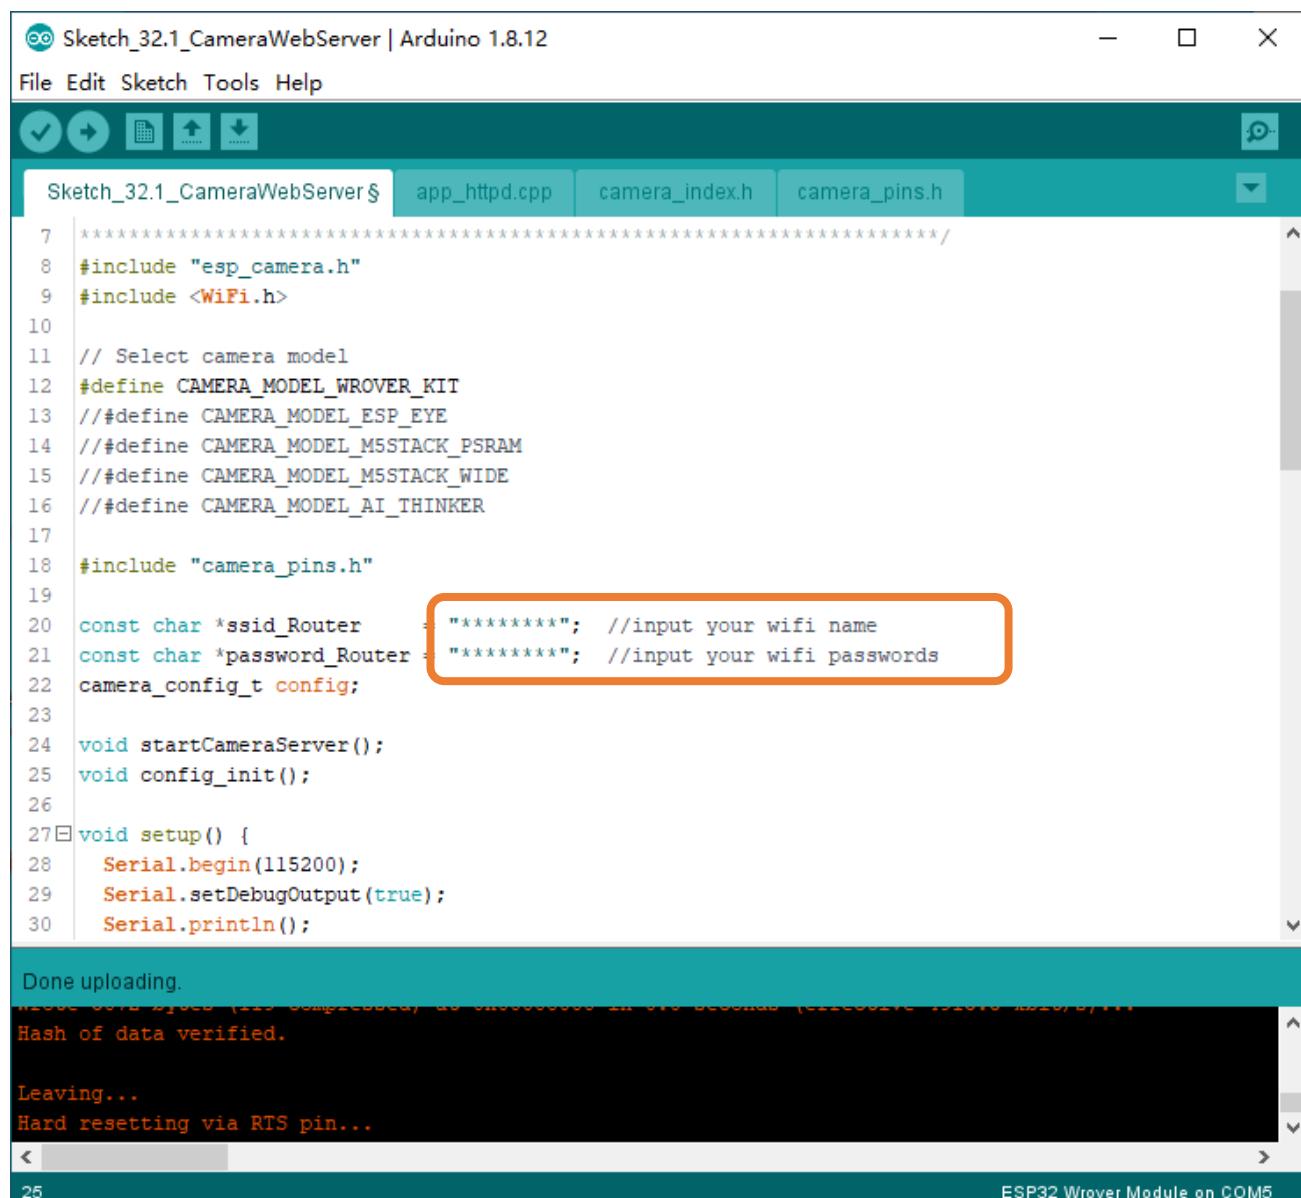

Circuit

Connect Freenove ESP32 to the computer using USB cable.

Sketch

Sketch_24.1_As_CameraWebServer

```
Sketch_32.1_CameraWebServer | Arduino 1.8.12

ESP32 Wrover Module on COM5

Before running the program, please modify your router's name and password in the box shown in the illustration above to make sure that your Sketch can compile and work successfully.

If your Arduino IDE prompts you that your sketch is out of your project's storage space, compile the code again as configured below.

Compile and upload codes to ESP32, open the serial monitor and set the baud rate to 115200, and the serial monitor will print out a network link address.

```

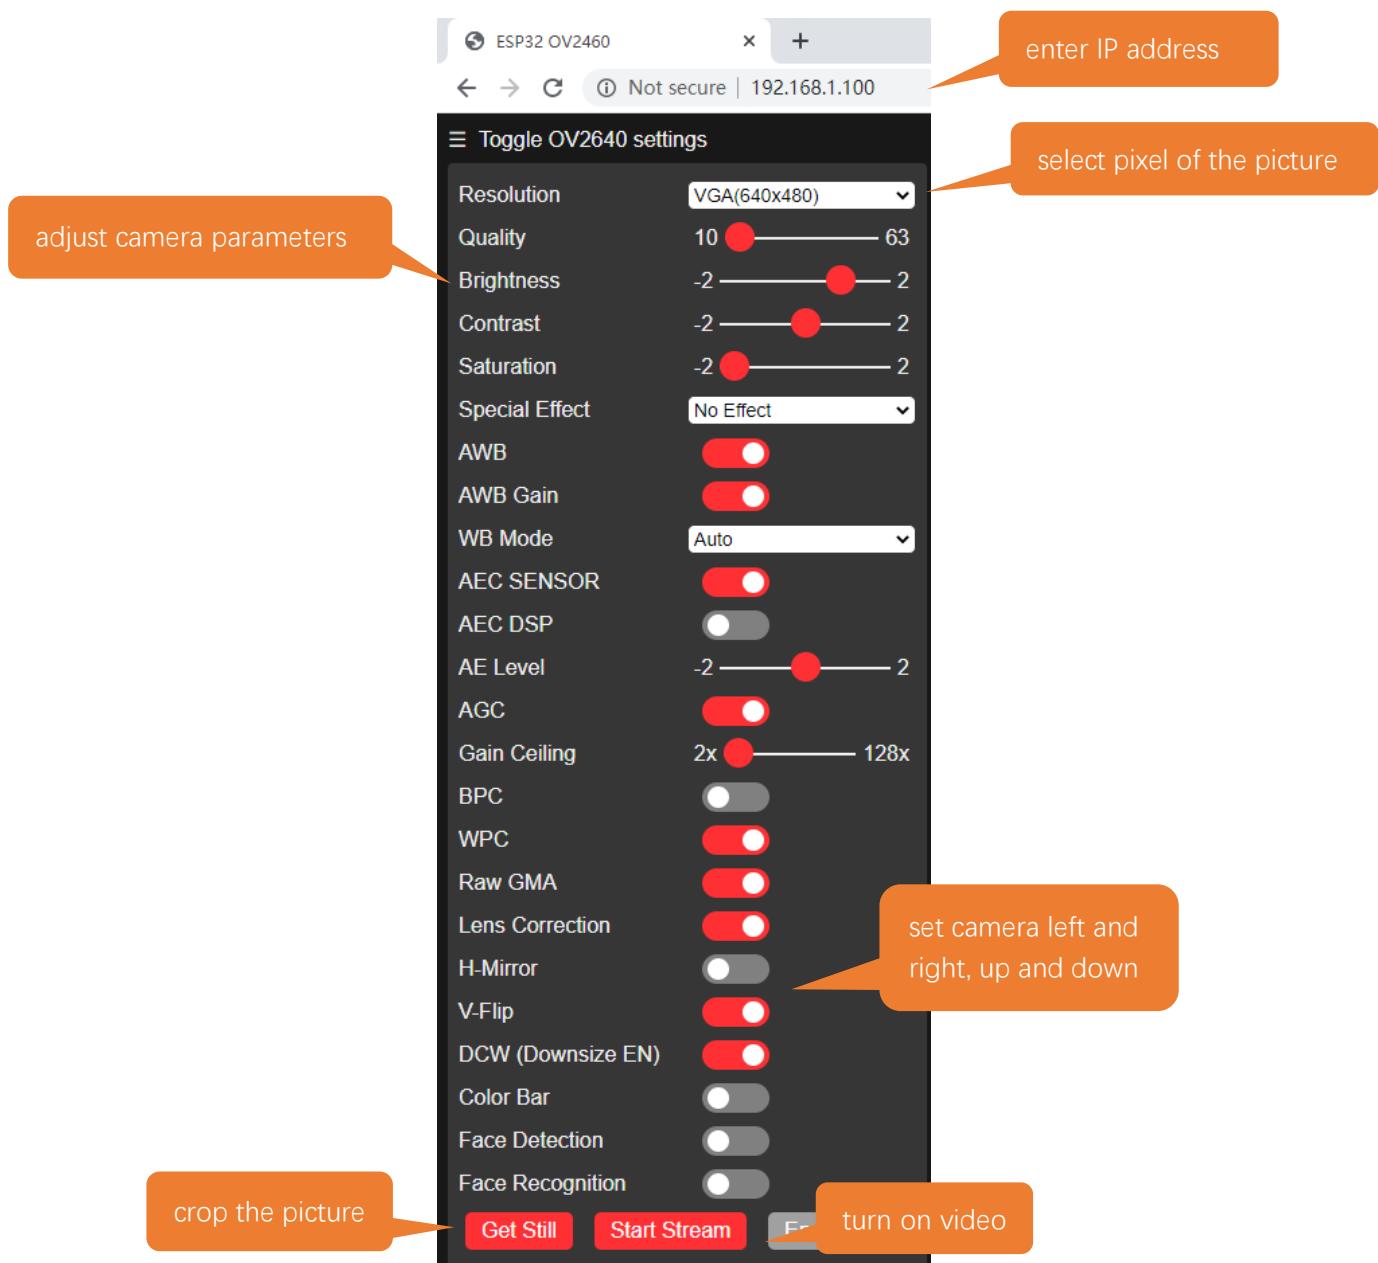

COM4
Send
?
.
WiFi connected
Starting web server on port: '80'
Starting stream server on port: '81'
Camera Ready! Use 'http://192.168.1.100' to connect
  
```

The serial monitor output shows the following text:

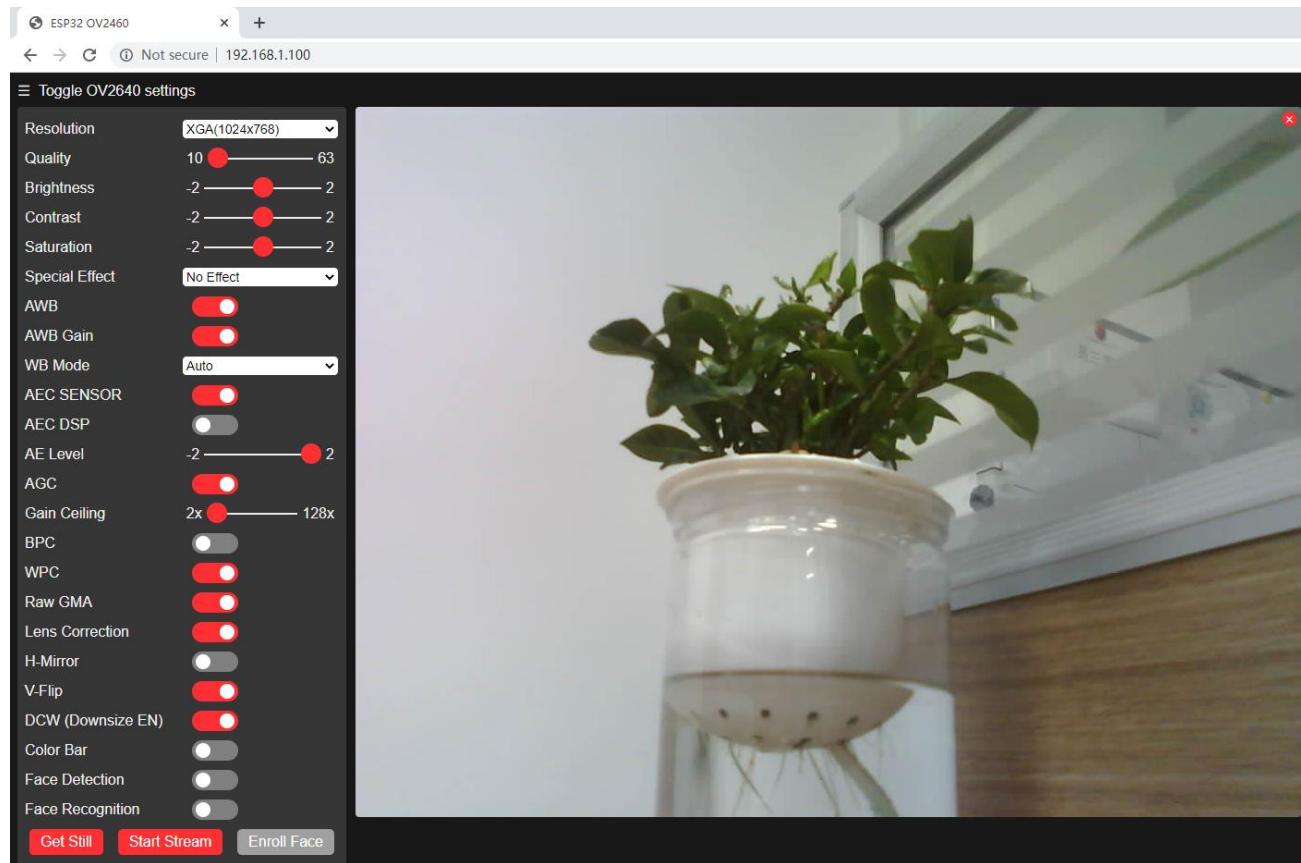

- WiFi connected
- Starting web server on port: '80'
- Starting stream server on port: '81'
- Camera Ready! Use 'http://192.168.1.100' to connect

If your ESP32 has been in the process of connecting to router, but the information above has not been printed out, please re-check whether the router name and password have been entered correctly and press the reset key on ESP32-WROVER to wait for a successful connection prompt.

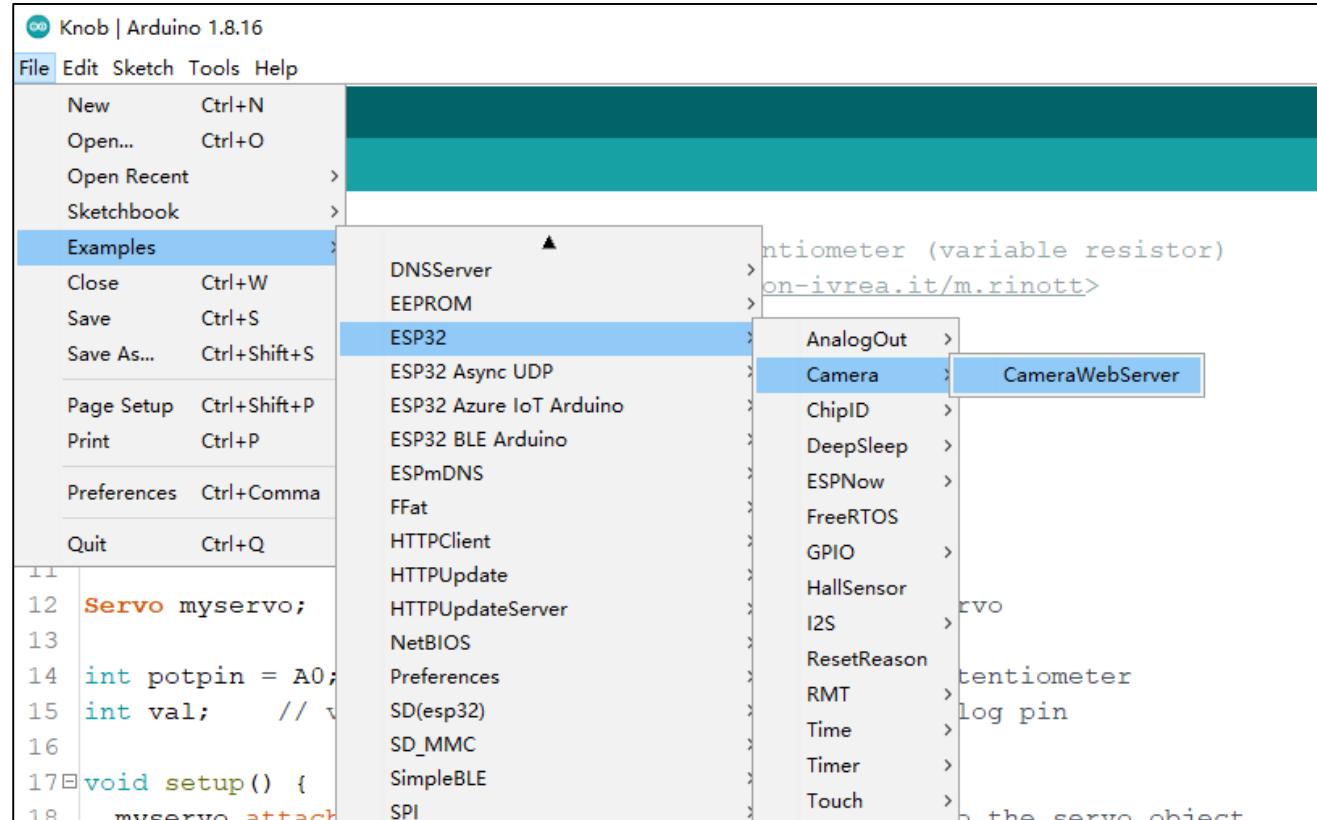

Open a web browser, enter the IP address printed by the serial monitor in the address bar, and access it. Taking the Google browser as an example, here's what the browser prints out after successful access to ESP32's IP.

Click on Start Stream. The effect is shown in the image below.

Note: If sketch compilation fails due to ESP32 support package, follow the steps of the image to open the CameraWebServer. This sketch is the same as described in the tutorial above.

Any concerns? [✉ support@freenove.com](mailto:support@freenove.com)

The following is the main program code. You need include other code files in the same folder when write your own code.

```
1 #include "esp_camera.h"
2 #include <WiFi.h>
3
4 // Select camera model
5 #define CAMERA_MODEL_WROVER_KIT
6 // #define CAMERA_MODEL_ESP_EYE
7 // #define CAMERA_MODEL_M5STACK_PSRAM
8 // #define CAMERA_MODEL_M5STACK_WIDE
9 // #define CAMERA_MODEL_AI_THINKER
10
11 #include "camera_pins.h"
12
13 const char *ssid_Router      = "*****"; //input your wifi name
14 const char *password_Router = "*****"; //input your wifi passwords
15 camera_config_t config;
16
17 void startCameraServer();
18 void config_init();
19
20 void setup() {
21     Serial.begin(115200);
22     Serial.setDebugOutput(true);
23     Serial.println();
24
25     config_init();
26     config.frame_size = FRAMESIZE_VGA;
27     config.jpeg_quality = 10;
28
29     // camera init
30     esp_err_t err = esp_camera_init(&config);
31     if (err != ESP_OK) {
32         Serial.printf("Camera init failed with error 0x%x", err);
33         return;
34     }
35
36     sensor_t * s = esp_camera_sensor_get();
37     s->set_vflip(s, 1);           //flip it back
38     s->set_brightness(s, 1);     //up the brightness just a bit
39     s->set_saturation(s, -1);   //lower the saturation
40
41     WiFi.begin(ssid_Router, password_Router);
42     while (WiFi.status() != WL_CONNECTED) {
```

```
43     delay(500);
44     Serial.print(".");
45 }
46 Serial.println("");
47 Serial.println("WiFi connected");
48
49 startCameraServer();
50
51 Serial.print("Camera Ready! Use 'http://");
52 Serial.print(WiFi.localIP());
53 Serial.println(" to connect");
54 }
55
56 void loop() {
57 ;
58 }
59
60 void config_init() {
61 config.ledc_channel = LEDC_CHANNEL_0;
62 config.ledc_timer = LEDC_TIMER_0;
63 config.pin_d0 = Y2_GPIO_NUM;
64 config.pin_d1 = Y3_GPIO_NUM;
65 config.pin_d2 = Y4_GPIO_NUM;
66 config.pin_d3 = Y5_GPIO_NUM;
67 config.pin_d4 = Y6_GPIO_NUM;
68 config.pin_d5 = Y7_GPIO_NUM;
69 config.pin_d6 = Y8_GPIO_NUM;
70 config.pin_d7 = Y9_GPIO_NUM;
71 config.pin_xclk = XCLK_GPIO_NUM;
72 config.pin_pclk = PCLK_GPIO_NUM;
73 config.pin_vsync = VSYNC_GPIO_NUM;
74 config.pin_href = HREF_GPIO_NUM;
75 config.pin_sscb_sda = SIOD_GPIO_NUM;
76 config.pin_sscb_scl = SIOC_GPIO_NUM;
77 config.pin_pwdn = PWDN_GPIO_NUM;
78 config.pin_reset = RESET_GPIO_NUM;
79 config.xclk_freq_hz = 20000000;
80 config.pixel_format = PIXFORMAT_JPEG;
81 config.fb_count = 1;
82 }
```

Add procedure files and API interface files related to ESP32 camera.

```

1 #include "esp_camera.h"
2 #include <WiFi.h>
3
4 // Select camera model
5 #define CAMERA_MODEL_WROVER_KIT
6 // #define CAMERA_MODEL_ESP_EYE
7 // #define CAMERA_MODEL_M5STACK_PSRAM
8 // #define CAMERA_MODEL_M5STACK_WIDE
9 // #define CAMERA_MODEL_AI_THINKER
10
11 #include "camera_pins.h"
```

Enter the name and password of the router

```

13 const char *ssid_Router      = "*****"; //input your wifi name
14 const char *password_Router = "*****"; //input your wifi passwords
```

Initialize serial port, set baud rate to 115200; open the debug and output function of the serial.

```

21 Serial.begin(115200);
22 Serial.setDebugOutput(true);
23 Serial.println();
```

Configure parameters including interface pins of the camera. Note: It is generally not recommended to change them.

```

60 void config_init() {
61     config.ledc_channel = LEDC_CHANNEL_0;
62     config.ledc_timer = LEDC_TIMER_0;
63     config.pin_d0 = Y2_GPIO_NUM;
64     config.pin_d1 = Y3_GPIO_NUM;
65     config.pin_d2 = Y4_GPIO_NUM;
66     config.pin_d3 = Y5_GPIO_NUM;
67     config.pin_d4 = Y6_GPIO_NUM;
68     config.pin_d5 = Y7_GPIO_NUM;
69     config.pin_d6 = Y8_GPIO_NUM;
70     config.pin_d7 = Y9_GPIO_NUM;
71     config.pin_xclk = XCLK_GPIO_NUM;
72     config.pin_pclk = PCLK_GPIO_NUM;
73     config.pin_vsync = VSYNC_GPIO_NUM;
74     config.pin_href = HREF_GPIO_NUM;
75     config.pin_sscb_sda = SIOD_GPIO_NUM;
76     config.pin_sscb_scl = SIOC_GPIO_NUM;
77     config.pin_pwdn = PWDN_GPIO_NUM;
78     config.pin_reset = RESET_GPIO_NUM;
79     config.xclk_freq_hz = 20000000;
80     config.pixel_format = PIXFORMAT_JPEG;
81     config.fb_count = 1;
82 }
```

ESP32 connects to the router and prints a successful connection prompt. If it has not been successfully connected, press the reset key on the ESP32-WROVER.

```

41 WiFi.begin(ssid_Router, password_Router);
42 while (WiFi.status() != WL_CONNECTED) {
43     delay(500);
44     Serial.print(".");
45 }
46 Serial.println("");
47 Serial.println("WiFi connected");

```

Open the video streams server function of the camera and print its IP address via serial port.

```

49 startCameraServer();
50
51 Serial.print("Camera Ready! Use 'http://'");
52 Serial.print(WiFi.localIP());
53 Serial.println(" to connect");

```

Configure the display image information of the camera.

The `set_vflip()` function sets whether the image is flipped 180°, with 0 for no flip and 1 for flip 180°.

The `set_brightness()` function sets the brightness of the image, with values ranging from -2 to 2.

The `set_saturation()` function sets the color saturation of the image, with values ranging from -2 to 2.

```

36 sensor_t * s = esp_camera_sensor_get();
37 s->set_vflip(s, 1);           //flip it back
38 s->set_brightness(s, 1);      //up the brightness just a bit
39 s->set_saturation(s, -1);    //lower the saturation

```

Modify the resolution and sharpness of the images captured by the camera. The sharpness ranges from 10 to 63, and the smaller the number, the sharper the picture. The larger the number, the blurrier the picture. Please refer to the table below.

```

26 config.frame_size = FRAMESIZE_VGA;
27 config.jpeg_quality = 10;

```

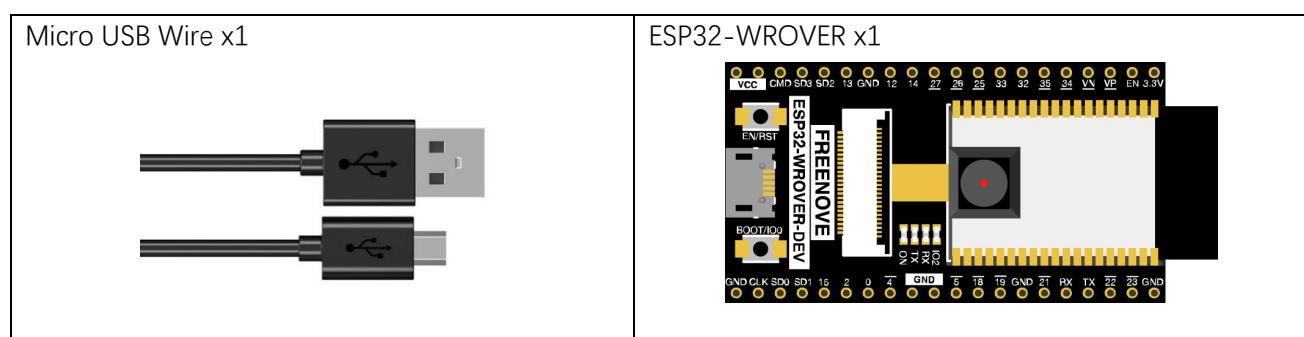

Reference

Image resolution	Sharpness	Image resolution	Sharpness
FRAMESIZE_QQVGA	160x120	FRAMESIZE_VGA	640x480
FRAMESIZE_QQVGA2	128x160	FRAMESIZE_SVGA	800x600

Project 24.2 Video Web Server

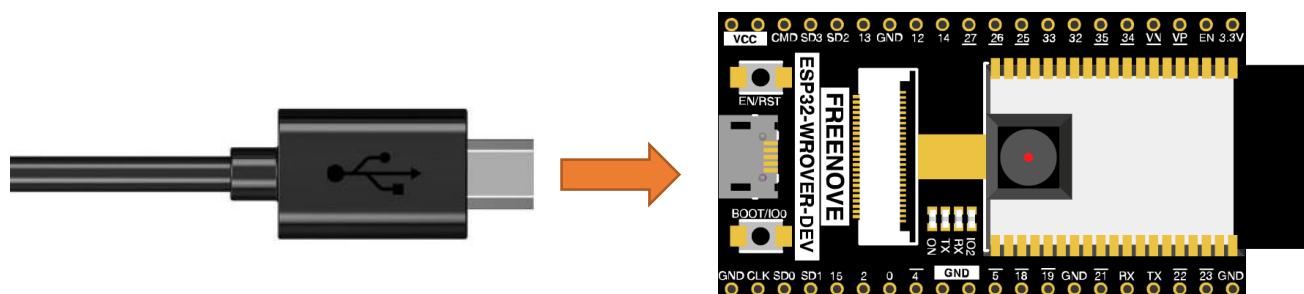

Connect to ESP32 using USB and view its IP address through a serial monitor. Access IP addresses through web pages to obtain real-time video data.

Component List

Circuit

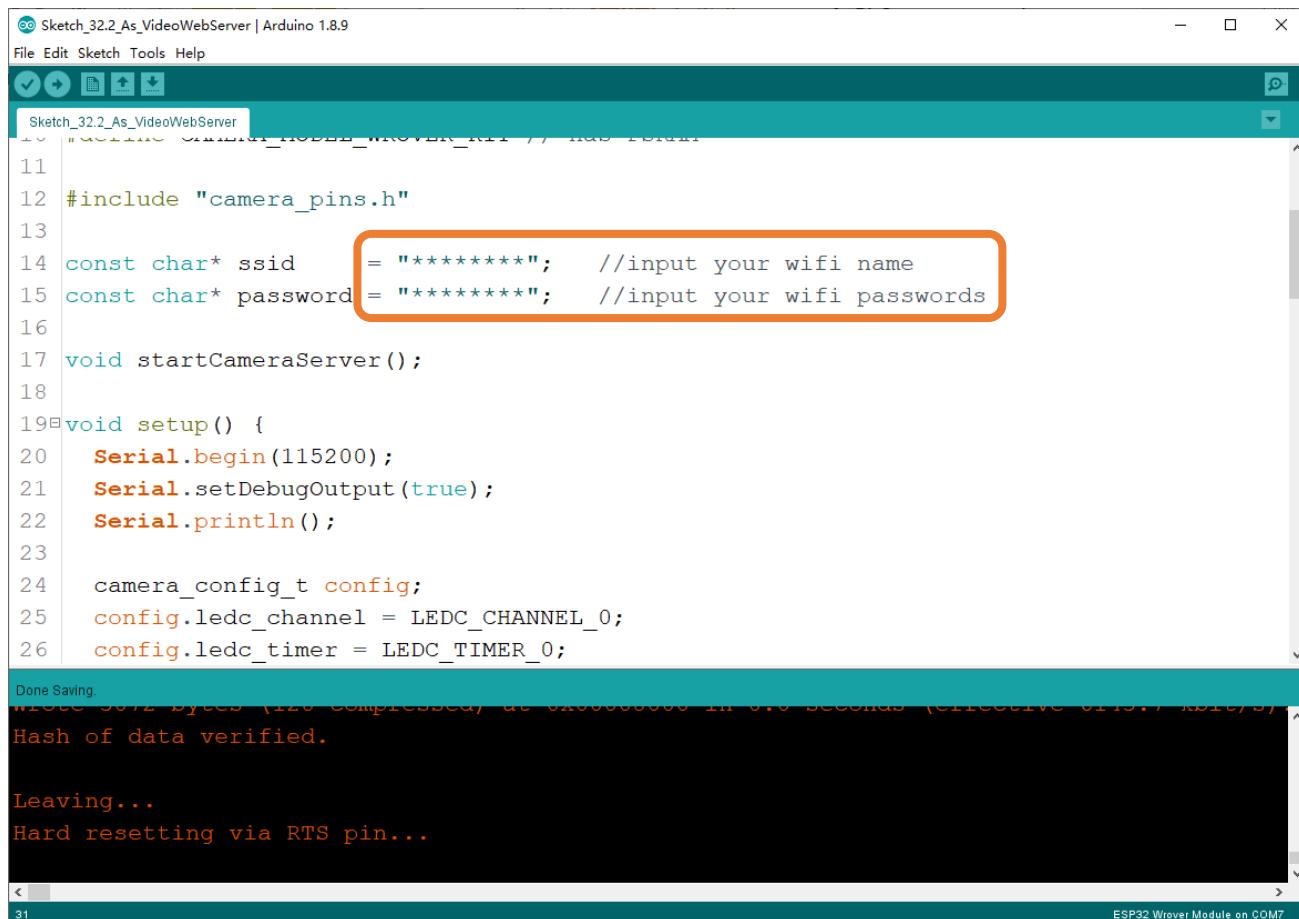

Connect Freenove ESP32 to the computer using USB cable.

Any concerns? support@freenove.com
